Foreword

Against the backdrop of solid economic growth worldwide, global intellectual property (IP) filing activity set new records in 2017. Patent filings around the world reached 3.17 million, representing a 5.8% growth on 2016 figures. Trademark filing activity totaled 12.39 million, up 26.8% on 2016. Industrial design filing activity exceeded 1.24 million. China remained the main driver of global growth in IP filings. From already high levels, patent filings in China grew by 14.2% and trademark filing activity in China by 55.2%. These high growth rates propelled China's shares of global patent filings and trademarks filing activity to reach 43.6% and 46.3%, respectively.

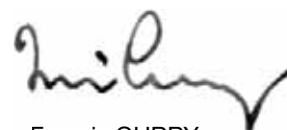

Japan (+24.2%) and the United States of America (+12.6%) also saw strong growth in trademark filing activity. However, both of those countries recorded almost no growth in patent filings. The Republic of Korea saw a decline in filing activity for patents and trademarks for the second consecutive year. Other notable trends include large increases in trademark filing activity in the Islamic Republic of Iran (+87.9%), the United Kingdom (+24.1%) and Canada (+19.5%). With regard to industrial design filing activity, the United Kingdom (+92.1%), Spain (+23.5%) and Switzerland (+17.9%) saw double-digit growth in 2017.

The special theme of this year's edition of WIPO's *World Intellectual Property Indicators* explores how one might statistically capture patent litigation activity. It compares patent litigation systems across jurisdictions and documents the challenges associated with collecting comprehensive and comparable patent litigation data. It also presents selected statistics available for the United Kingdom and the United States of America.

For the first time, this year's edition includes statistics on the creative economy. In particular, on the basis of an original survey jointly conducted with the International Publishers Association, we report key performance data on publishing activity covering 28 countries. We recognize that these statistics are in many ways still incomplete, but view them as a first step toward establishing a more complete and comparable picture of global publishing activity worldwide. In the longer term, we also hope to include other parts of the creative economy in our statistical reporting.

Readers wishing to go beyond the statistics presented in this report can use the statistical tools on WIPO's website (www.wipo.int/ipstats), notably the IP Statistics Data Center and the Statistical Country Profiles.

Finally, I would like to thank our member states, as well as national and regional IP authorities, for sharing their annual statistics with WIPO. Their invaluable cooperation makes the *World Intellectual Property Indicators* possible.

Francis GURRY
Director General

Acknowledgements

World Intellectual Property Indicators 2018 was prepared under the direction of Francis Gurry (Director General) and supervised by Carsten Fink (Chief Economist). The report was prepared by a team led by Mosahid Khan and comprising Kyle Bergquist, Ryan Lamb, Bruno Le Feuvre and Hao Zhou, all from the Economics and Statistics Division. The geographical indications section was prepared by Matteo Gragnani and benefited greatly from the inputs contributed by Alexandra Grazioli, from the Brands and Designs Sector. Peter Button of the International Union for the Protection of New Varieties of Plants (UPOV) provided comments and suggestions for the plant varieties section. The special theme on patent litigation is based on a background paper prepared by Professor Christian Helmers of Santa Clara University. It also draws on helpful input received from Andrew Toole, Chief Economist of the USPTO.

Samiah Do Carmo Figueiredo and Caterina Valles Galmes provided administrative support. Gratitude is also due to the Communications Division for the editing and design and to staff in the Printing Plant for their services.

Note: Due to the new way in which the intellectual property (IP) office of China counts its IP applications received in 2017, the 2016 and 2017 patent, industrial design and utility model application data for China are not comparable. Prior to 2017, it included all applications received in its totals; however, starting in 2017, all China's application counts include only those applications for which the office has received the necessary application fees.

Special theme

An overview of patent litigation systems across jurisdictions

Introduction

The ability of patent right holders to enforce their intangible property rights when those rights are infringed is an important aspect of the patent system. The value of patents will diminish if right holders are unable to enforce their patent rights. During the past decade, patent disputes have generated news headlines, and attracted considerable attention from both practitioners and policymakers. This is partly due to widely publicized, protracted litigation between well-known technology companies; most notably litigation involving Apple, Huawei, Samsung and Qualcomm. For example, after seven years of litigation, Apple and Samsung settled their patent disputes in 2018.¹ Furthermore, patent litigation has also involved patent assertion entities (PAEs), and there have been a number of litigations involving standard essential patents, all of which have put the functioning of the patent litigation systems in the spotlight.

Apart from the high-profile cases reported in the media, many jurisdictions lack systematic data on patent litigations. Enhancing data availability by effectively monitoring the functioning of the patent litigation system would facilitate evidence-based policymaking. The rise in patent litigation in the United States of America (U.S.) over the past years is well-documented (Cook, 2007; Meurer and Bessen, 2013).² However, for other jurisdictions, data on patent litigation activity is either incomplete or unavailable. For example, in the U.S., comprehensive data on court cases are available through both public and private sources, allowing detailed analysis of litigation; while in Germany and the Republic of Korea, only incomplete data are available.

While the patent system in general makes enormous amounts of information and data available to the public, patent litigation has occurred largely out of sight, in the privacy of the court system. As a result, it is often difficult to gauge the magnitude of patent litigation in the various jurisdictions. There have been individual efforts by researchers to compile and analyze litigation data, but these efforts were conducted on an ad hoc basis (Cremers *et al.*, 2016a; Helmers and McDonagh, 2013).

There have been a number of attempts to address this issue outside of the U.S. and substantial progress

has been made in some jurisdictions, notably in China where all decisions by courts are supposed to be made publicly available online. However, in practice, coverage is below 100 percent and the data cover infringement decisions only. Commercial data providers have, nevertheless, tapped into this market and made significant investments to improve the existing data infrastructure covering many jurisdictions.

The objective of this section is to explore how one might statistically capture patent litigation activity.³ It compares patent litigation systems across jurisdictions and documents the challenges involved in collecting comprehensive and comparable patent litigation data. It also presents selected statistics available within the United Kingdom (U.K.) and the U.S.⁴

An overview of patent litigation systems

The main objective of patent litigation is to allow patent owners to enforce their patent claims against potential infringers. As in any type of litigation, the judicial system deals with disputes that could not be settled by the parties out of court and which therefore require adjudication. While the structure of patent litigation proceedings in court is similar across jurisdictions, there are nevertheless important differences. It is therefore useful to review the basic structure common to all patent litigation systems and highlight some of the ways in which systems differ around the world.

One of the most important differences in the various jurisdictions of patent litigation systems is whether they follow a unified or a bifurcated system. In a unified system, infringement and invalidity are dealt with within the same proceedings, where invalidity is usually raised as a defense by the defendant to the infringement claim by the plaintiff. The judge will assess both claims simultaneously, which implies that a patent that is found to be invalid cannot be infringed. In a bifurcated system, there are separate proceedings in different venues to establish infringement and invalidity. In this system, invalidity is not usually an admissible defense to an infringement claim. The defendant will concentrate on a non-infringement defense while potentially attempting to invalidate the patent in parallel at the competent venue. Since the question of validity has a direct effect on infringement proceedings, courts have the option to stay infringement proceedings until validity has been decided.

In most jurisdictions, validity is decided not only by the courts but also administratively by the intellectual property (IP) office. Such administrative validity challenges can take the form of a post-grant opposition that allows third parties to challenge validity within

a certain period after the grant. For example, at the European Patent Office (EPO), opposition to the granting of a patent can be filed within nine months of the mention of the grant in the *European Patent Bulletin*. Whether infringement and validity are dealt with in a unified or bifurcated system has a number of important effects on patent litigation behavior and outcomes. For example, depending on the design of the bifurcated system, it is possible for the infringement decision to be made before the invalidity decision. This implies that a patent may be found to be infringed that is eventually invalidated (Cremers *et al.*, 2016b). Bifurcation may also have a direct effect on litigation behavior. Evidence from Germany and the U.K. suggests that a bifurcated system, in which infringement is usually decided first, leads to fewer validity challenges than a unified system. Moreover, infringement actions are more likely to be settled (Cremers *et al.*, 2016b).

The number of courts which are competent to hear patent cases differs significantly across jurisdictions. In the U.S., 94 federal district courts are competent to hear patent cases. Patent infringement claims can also be brought before the International Trade Commission (ITC), but the ITC cannot award monetary damages. In Germany, 12 regional courts are competent to hear first-instance patent infringement claims. In other jurisdictions, such as France or the Netherlands, there is only a single court competent to hear patent cases. In the U.K., there are two courts that hear patent cases,

with one (the Intellectual Property Enterprise Court – IPEC) hearing cases that are less complex and of a lower value than the other (the Patents Court – PHC). In Germany, some regional courts have specialist chambers that hear patent cases. In the U.S., the Court of Appeals for the Federal Circuit (CAFC) is a specialized court, while first-instance district courts are not. The availability of different courts in which to file a claim may provide the opportunity to engage in forum shopping; that is, to make a strategic choice of court venue. This type of behavior may have an impact on the litigation statistics.

The costs associated with patent litigation vary significantly between jurisdictions. For example, in France, cost estimates for each party range between USD 60,000 and USD 250,000 while in Germany they range from USD 90,000 to USD 250,000 (Cremers *et al.*, 2016a). These costs are low in comparison to other jurisdictions, such as the U.K. or the U.S. where costs are commonly well over USD 1 million (Helmers and McDonagh, 2013; AIPLA, 2017). Such large disparities are explained by a number of factors, including the extent of pre-trial discovery and the role of expert witnesses, as well as the length and complexity of the trials themselves.

Table S1 provides an overview of the main characteristics of patent litigation systems for selected jurisdictions.

S1. Overview of the main characteristics of major patent litigation systems

Characteristics	Jurisdiction							
	China	France	Germany	Japan	Netherlands	Republic of Korea	U.K.	U.S.
Bifurcated	Yes	No	Yes	Yes	No	Yes	No	No
Administrative post-grant review	No	Yes (EPO)	Yes (EPO, DPMA)	Yes	Yes (EPO)	Yes	Yes (EPO)	Yes
Jury trial	No	No	No	No	No	No	No	Yes
Preliminary injunction	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes

Challenges associated with compiling and analyzing patent litigation data

Compiling and analyzing patent litigation data is an extremely difficult task for the following reasons:

- (a) patent litigation is considered one of the most complex forms of civil litigation,
- (b) litigation settled before reaching the court system is not publicly documented,
- (c) private information exchanged between parties is not revealed to the court or, even if revealed, it is not recorded,
- (d) information on cases is not centrally collated in many jurisdictions (i.e., information has to be accessed from individual courts), and
- (e) there are also substantial differences between jurisdictions that affect the interpretation of observed litigation data and make any direct comparison of litigation across jurisdictions challenging.

In most jurisdictions, no official aggregate statistics of patent litigation activity are available. Consequently, it is difficult to verify the completeness of any case-level data set unless the data were collected directly from court records. Collecting court records and converting them into a statistical database of patent litigation is a resource-intensive task.

One of the most frequently used patent litigation indicators is the number of cases. However, there is enormous heterogeneity in court cases, as well as in administrative post-grant reviews, even within the same jurisdiction. This creates challenges when constructing case counts and comparing those counts between jurisdictions. For example, in a bifurcated jurisdiction, court cases will be predominantly infringement claims. Invalidity challenges are recorded as separate cases, even when the validity challenge occurred as a direct response to an infringement action. In a unified system, an infringement action with an invalidity defense would show up only as a single case. One way to account for such heterogeneity is to count cases by type of claim.

Another source of heterogeneity is the number of asserted patents. Plaintiffs may assert claims relating to a single patent or to multiple patents in a case, and courts may decide either to split a case that involves several patents into separate actions or to consolidate separate actions into a single proceeding. A similar problem also arises in post-grant reviews. Multiple parties can file a post-grant administrative validity challenge on the same patent. At the EPO, for example, if several parties oppose a given patent, these multiple oppositions are consolidated into a single proceeding at the end of the nine-month opposition period. In the U.S., in contrast, multiple challenges in the form of an *inter partes* review (IPR) at the Patent Trial and Appeal

Board (PTAB) start off as separate petitions that may be joined at some point in the process. This means that a simple count of IPR petitions and a direct comparison with EPO oppositions might be misleading.

Court cases may involve different patent types. For example, court cases in China, Germany or the Republic of Korea may involve utility models; in China or the U.S. they may involve design patents. To facilitate comparability across time, courts, and jurisdictions, it is important to distinguish cases according to the type of patent involved.

The number of patent case counts is often not particularly informative, especially when compared over time or across jurisdictions. To facilitate comparison, litigation rates are often used. The main challenge in constructing these rates is determining their denominator; that is, the measure that is used to weigh the litigation case count. Cremers *et al.* (2016a), for example, use the following:

- (a) annual patent filings in a given jurisdiction,
- (b) the total number of patents in force in a given jurisdiction,
- (c) gross domestic product in a given jurisdiction, and
- (d) gross domestic research and development (R&D) spending in a given jurisdiction.

A problem common to these different ways of constructing litigation rates is that their interpretation is unclear. If a rate is low, does that mean that there are fewer underlying disputes, or does it mean that a smaller share of disputes makes it to court, either because they are settled before reaching court or because patent owners decide not to enforce their rights?

Interpreting the outcome of a court case is not straightforward either. In a validity challenge, often only a subset of claims is challenged and invalidated. Depending on the jurisdiction, it may also be possible for the patent owner to amend the claims of the patent during the proceedings and thereby keep the patent alive, albeit with a narrower scope. During infringement proceedings, it is equally possible that infringement is found only with respect to a subset of asserted claims. This means that often the outcome of a case is not as clear cut as is required for a binary coding (win or loss) of the outcome. This situation is further complicated by the appeals process. Depending on the jurisdiction, appeals that could result in first-instance decisions being overturned can be relatively common. Moreover, first-instance decisions may be only partly overturned, further adding to the complexity of the overall case outcome.

Only court cases are observed. Any disputes that are resolved or dropped before the plaintiff files the

complaint with a court remain undocumented.⁵ This poses a challenge for empirical work as it is practically impossible to account for this type of selection since no information on the underlying set of all patent disputes is available. Some cases are dropped or settled immediately following the filing of the complaint. For these disputes, often the only information available in the case docket is the information provided in the complaint together with the fact that the case did not proceed. If the case is pursued further, more information will be recorded, for example documenting a motion. Parties have the opportunity to settle at any point in the proceedings. This means that the amount of information available regarding a specific case depends on whether and when the parties settled the case. Only in the event that a case proceeds sufficiently for a summary judgment to be available, or if the judge or jury hands down a verdict, is the actual outcome of the case observed. It is important to emphasize that the set of cases decided by a court represents highly selected subsets of cases and is not representative of all the patent disputes filed with the court, and even less so of all the patent disputes that never reach a court. Cases that are decided on appeal are even more highly selected subsets of patent cases and are clearly not representative of patent disputes more generally.

The analysis of litigation data is also challenging due to frequent changes in the law and its application. The U.S., for example, has seen a number of landmark Supreme Court decisions in the past few years that have had a significant impact on litigation behavior.⁶ In addition, institutional changes, such as the introduction of opposition procedures in Japan and the Republic of Korea in 2015 and 2017, respectively, or the comprehensive reform of the Patents County Court and its reconstitution as IPEC in the U.K. between 2010 and 2013, are likely to have impacted litigation behavior. The same is true for sweeping legislative changes, such as the one brought about by the America Invents Act (AIA) in the U.S. in 2011. From a policy perspective, studying the effect of such changes on litigation behavior and outcomes is worthwhile in its own right. However, it also means that any analysis of litigation data will have to take the impact of those changes on litigation behavior into account. This is of particular concern with regard to court decisions and institutional changes that, at first glance, may not affect litigation directly, such as changes to post-grant review systems.

Data availability

The main challenge in the analysis of patent litigation lies in the limited availability of case-level information from the courts. However, even when detailed records are available, transforming these records into a sta-

tistical database is fraught with difficulties. Data on administrative post-grant validity challenges are more easily accessible and, to some degree, less complex, as only validity is at issue.

In the U.S., court data are made available by the Administrative Office of the Courts on the Public Access to Court Electronic Records (PACER) system to any registered user. PACER offers access to all cases heard by district courts, the CAFC and the Supreme Court. The data provided through PACER are considered to provide complete coverage of all patent cases in the U.S. from the mid-2000s onward (Schwartz and Sichelman, forthcoming). However, PACER is not designed to generate data that lend themselves easily to statistical analysis. The United States Patent and Trademark Office (USPTO) has recently made the PACER data available for download (Marco *et al.*, 2017). The resulting USPTO Patent Litigation Docket Reports Data cover the period from 1963 to 2015, although the coverage of the pre-2000 data is probably incomplete as not all records are available in electronic format. Data on PTAB proceedings are also publicly available from the USPTO website. While all documents can be downloaded free of charge, the data are not made available for download in a format that facilitates statistical analysis. Unified Patents also offers free access to the data in a more user-friendly format, but there is no bulk download functionality.⁷

In Germany, case-level data are available from official court websites. However, there are a number of problems associated with these publicly available data. There is no court diary or case index that allows verification that all cases filed with a given court are recorded. Moreover, case documents may be redacted; for example, patent numbers or the names of litigating parties are frequently missing from the publicly available documents. Despite the limitations, publicly available data for Germany have been used in research (e.g., Elsner and Zingg, 2018).

In the U.K., basic information on cases listed for a hearing is available from the official court diary. The diary lists all cases for which a claim form has been filed by the plaintiff and the court has scheduled some type of hearing or application. The diary contains basic information on the case, including the case number, the names of the plaintiff and defendant, and the date of the hearing. The diary may also include information on the status of a case – for example, if it has been discontinued due to a settlement. The website of the British and Irish Legal Information Institute (BAILII) contains court records, including published judgments, where court documents for cases listed in the court diary can be found. Alternative online resources are Lexis Nexis and the Thomson Reuters Westlaw database. In the U.K., these documents usually contain

unredacted information on court cases. However, often only a single document on a case is available online, which may not provide all of the relevant information for a given case. The fact that usually not all court records for a given case are observed when the data are assembled from publicly accessible online sources means that the analysis will necessarily be limited. For example, it may not be possible to determine whether specific motions (e.g., for a stay or summary judgment) were filed during proceedings, especially in the event that they were unsuccessful. Such motions may have impacted the parties' litigation behavior, but it is not possible to determine the extent of their effect from the data. Moreover, BAILII does not publish every court record; decisions that are deemed to be more important are more likely to be posted online, creating selection bias in any data set constructed solely from records available on BAILII.

Data on EPO oppositions are available in EPO's Patent Register, which is offered as a data set designed for the purposes of statistical analysis. The ready availability of these data has led to a relatively large amount of research on EPO oppositions.

Since 2014, all decisions by courts in China are publicly available on the China Judgments Online website. In practice, coverage is still well below 100 percent. Moreover, the data only cover infringement decisions as invalidity challenges are decided exclusively by the China National Intellectual Property Administration (CNIPA).

In the case of Japan, the IP High Court provides an online database of court decisions for all courts competent to hear patent cases in Japan.

There have been a number of efforts by academic researchers to collect data directly from the courts. For example, Cremers *et al.* (2016a) collected data directly from the three most important German regional courts (*Landgerichte* – LG) for the period 2000 to 2008. For France, Dumont (2015) collected data from the first-instance court in Paris for the period between 2008 and 2013. Helmers *et al.* (2016) collected case-level data from the two courts competent to hear IP cases in the U.K. – the IPEC and the PHC – for the period from 2007 to 2013.

A large number of commercial data providers and law firms offer access to patent litigation data covering different jurisdictions. However, access to those databases is generally expensive. In addition, information on data coverage and methodology is not always clear.

The USPTO post-grant review statistics

Since the introduction of the AIA in the U.S. in 2011, it has been possible to challenge the validity of patents granted by the USPTO through four different avenues: post-grant review, *inter partes* review, covered business method and *ex parte* reexamination. There has been a dramatic increase in PTAB trials since the implementation of the AIA (see figure S2). In contrast, *ex parte* reexamination has declined. However, the decrease in *ex parte* reexamination has been far less substantial than the increase in PTAB trials. This implies that the total number of post-grant challenges at the USPTO has risen substantially.

As mentioned above, not all IPRs are reviewed by PTAB. Only those IPRs that have a reasonable likelihood of success are instituted and reviewed by PTAB. Figure S3 shows both the total number of petitions and the number of petitions instituted, which follows a similar trend. However, starting in the third quarter of 2014, the share of instituted petitions dropped and continued to hover around 55 percent of total petitions for the remaining period. On average, PTAB made decisions on approximately 75 percent of all petitions instituted between 2012 and 2015. The decrease in the number of decisions since 2015 is due to data truncation.

Figure S4 shows a breakdown of petitions and institution decisions by technology area for the period from 2012 to 2016.⁸ The largest number of petitions was in the field of computer technology (670), followed by telecommunications (308) and digital communication (248). The share of petitions instituted varied from 94.4 percent in surface technology to 38 percent in other consumer goods. Among the top five technologies with the largest number of petitions, telecommunications has the highest institution rate (61.7 percent), followed by computer technology (55.2 percent), medical technology (52.9 percent), digital communication (51.6 percent) and audio-visual (51.2 percent).

Figure S5 shows the PTAB decisions for all IPRs instituted for the period from 2012 to 2016. For the majority of the fields of technology, the invalidation rate was over 80 percent. Among the top five fields of technology with the largest number of decisions, electrical machinery (84 percent) had the highest invalidation rate, followed by transport (81.3 percent), telecommunications (80.2 percent) and computer technology (79.2 percent).

The EPO post-grant opposition statistics

At the EPO, oppositions can be filed within nine months of the mention of the grant in the *European Patent Bulletin*. All oppositions that are filed during that time period are combined at the end of the nine-month period before oppositions proceedings begin. This means that the number of oppositions is not directly comparable to the number of IPRs because separate petitions for IPR for the same patent can be filed but are not necessarily combined into a single proceeding. Figure S6 shows that the number of oppositions held relatively steady, at around 3,000 per year, between 2012 and 2014. The decline during 2015 and 2016 is due to truncation of the available data.

S6. Total number of EPO oppositions, 2012–2016

Source: Helmers (2018).

The outcome of the EPO opposition proceedings by field of technology is presented in figure S7. Opposition to the granting of an EPO patent can result in the pat-

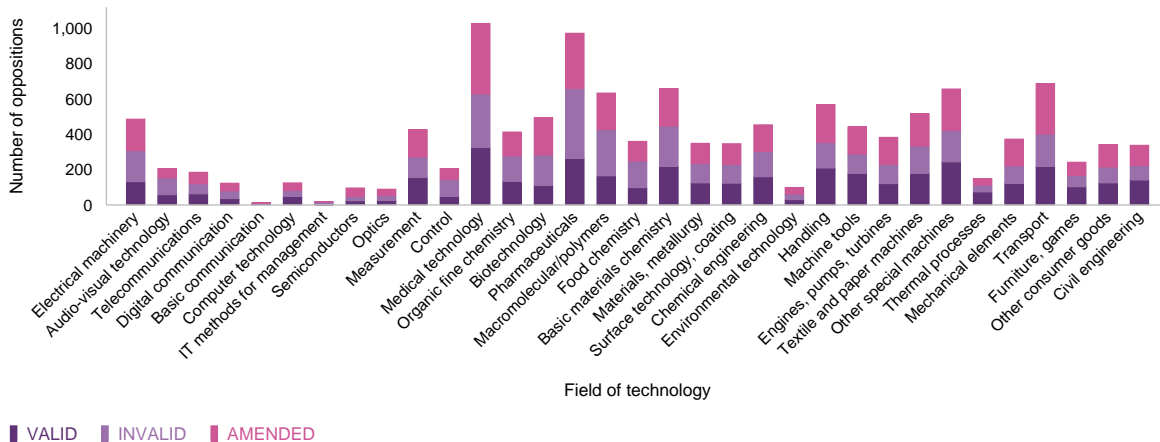

ent being invalidated, maintained in its current form or maintained in amended form. Patents related to medical technology attracted the largest number of oppositions (1,029), followed by pharmaceuticals (974), transport (689) and basic materials chemistry (660). In contrast, there were relatively few oppositions in computer technology, telecommunications and digital communication, which is probably explained by differences in the granting practices of software-related patents between the USPTO and the EPO. The distribution of outcomes is fairly even across technology areas; on average around 32 percent of opposed patents were invalidated, 32 percent were upheld and 36 percent were upheld in amended form.

U.K. and U.S. patent litigation statistics

The number of patent litigation cases filed in the U.S. grew gradually between 1999 and 2009. However, between 2009 and 2013 there was a period of considerable growth in the number of cases filed (see figure S8). A similar trend is observed for the U.K., where significant growth in the number of cases filed occurred between 2010 and 2012 (see figure S10). The strong growth in the number of cases filed in both the U.K. and the U.S. occurred during the so-called “global patent wars.”

As mentioned above, cases count data are often normalized using the number of filings, patents in force, gross domestic product, etc. Figure S9 presents data on the number of cases filed in the U.S. district courts normalized by patent grants and patents in force. Normalized cases count data follow the same overall trend – significant growth between 2009 and 2013 with a decline thereafter.

S10. Number of patent cases filed in the U.K. patents court and IPEC, 2007–2013

Source: Helmers (2018).

Figure S11 provides data on cases broken down by types of complaint: infringement, invalidity and other. The “other” category contains a range of patent-related claims, such as disputes regarding inventor- or ownership, false patent marking, licensing contracts, etc. The figure also distinguishes between cases that ended with a decision by the court or a settlement/dismissal. In both jurisdictions, the share of cases determined by court decision is very small. For example, in the U.S. around 10 percent of cases were decided in some way by the courts, while in the U.K. the figure was around 26 percent. Complaints in the U.S. almost all allege infringement of a patent, while a small share of total cases relates to an allegation of invalidity. In contrast, around 30 percent of cases in the U.K. start with a validity challenge. The share of cases decided by the courts in the U.K. is larger for validity challenges (32 percent) than for infringement claims (20 percent).

Figure S12 presents data on the interaction between litigation in court and administrative post-grant reviews. Interaction occurs when a patent that is litigated in court is challenged through an IPR in the U.S. or an opposition at the EPO. The figure shows the number of court cases that have a parallel administrative validity challenge at the EPO for U.K. patents and at the USPTO for U.S. patents. In the U.S., parallel IPRs are filed mainly in infringement cases by the defendant in an attempt to invalidate the patent administratively and thereby achieve a dismissal of the infringement case in court. In the U.K., a relatively large number of cases that challenge a patent’s validity in court also challenge the patent’s validity administratively at the EPO. Because courts in the U.K. often do not stay proceedings if an opposition is pending at the EPO, this strategy allows the plaintiffs to use all available venues to invalidate a patent.

Conclusions

This chapter has provided an overview of patent litigation systems across jurisdictions. It has documented common aspects applicable to court proceedings in different jurisdictions and outlined how the patent litigation systems differ. It has also outlined the challenges involved in collecting comprehensive and comparable patent litigation data from the various jurisdictions. It is important to understand the litigation system in order to properly interpret the data.

To monitor the functioning of the patent litigation system, data availability is crucial for evidence-based policymaking. However, data availability and access remain a major obstacle to the analysis of the patent litigation system. The U.S. has made significant efforts

to make patent litigation data available to researchers and policymakers. For example, the efforts of the USPTO (Marco *et al.*, 2017) provide a useful illustration of how to make patent litigation data available for statistical analysis. Beyond the U.S., there is a lack of publicly available official data. As an initial step, patent offices could develop statistical databases of administrative procedural information (e.g., detailed information on oppositions, invalidation, reexamination, etc.). With regard to court records, developing infrastructure to maintain a register of all patent-related cases could be a worthwhile route to take.

Patents

Highlights

Patent applications filed worldwide reached 3.17 million in 2017

Applicants around the world filed almost 3.17 million patent applications in 2017 – a record number (see figure 1.1). Applications grew by an estimated 5.8% on 2016. It is important to note that the intellectual property (IP) office of China revised its method of compiling patent applications statistics in 2017. Prior to 2017, it included all applications received; however, starting in 2017, China's application count data include only those applications for which the office has received the necessary application fees. At the same time, applying the new counting method retroactively, the IP office of China was able to report a growth rate of 14.2% in the number of patent applications filed in 2017 (see the data description section). This 14.2% growth rate for China was then used to calculate the estimated worldwide growth rate of 5.8%.

The long-term trend shows that patent applications worldwide have grown every year since 2003, with the exception of 2009 when they decreased by 3.8% due to the financial crisis.

Patent applications worldwide grew by 5.8%

1.1. Patent applications worldwide, 2001–2017

Source: Figure A1.

China received 1.38 million patent applications, double the number received by the United States of America (U.S.)

The National Intellectual Property Administration of the People's Republic of China received 1.38 million patent applications in 2017, which is more than double the number received by the United States Patent and Trademark Office (USPTO), which totaled 606,956. The Japan Patent Office was ranked third, with 318,479 applications. It was followed by the Korean Intellectual Property Office with 204,775 applications and the European Patent Office (EPO) with 166,585. Together, these top five offices accounted for 84.5% of the world total in 2017, which is much higher than their combined 2007 share (75.2%). China's share of the world total increased considerably between 2007 and 2017, while that of the remaining four offices declined over the same period.

The list of top 10 offices in 2017 is identical to the 2016 list. The ranking of top offices is relatively stable – any change in ranking has been gradual over the past 15 years, with the exception of the rapid rise of China. Figure 1.2 shows patent applications received by the top 10 offices, broken down by resident and non-resident filings. The IP offices of China, Japan and the Republic of Korea received the bulk of their applications from resident applicants. In contrast, Australia, Canada, India and the U.S. reported a high share of non-resident filings.

Looking beyond the top 10 offices to the top 20 list, 12 offices were located in high-income, six in upper middle-income and two in lower middle-income countries. In terms of geographical distribution, nine offices were located in Asia, six in Europe, two each in North America and Latin America and the Caribbean (LAC), and one in Oceania. South Africa is the highest ranked African office, in 22nd place.

Of the top 20 offices, 11 received a greater number of applications in 2017 than in 2016, while nine received fewer. China (+14.2%) and Turkey (+24.9%) are the only two offices to have experienced double-digit growth. Note that China's growth rate was reported by the IP office of China and is based on the new method of counting patent applications recently implemented by that office. China has experienced double-digit growth each year since 2010. Turkey has reported double-digit growth for the past three years and, as a result, its ranking has moved from 25th position in 2014 to 20th in 2017. The increases in number of applications filed in China and Turkey were both driven mainly by growth in resident applications.

IP office of China received 1.38 million applications

1.2. Patent applications at the top 10 offices, 2017

Source: Figure A8.

Of the nine offices among the top 20 that received fewer applications in 2017 than in 2016, the Russian Federation (–11.3%); Brazil (–8.4%); China, Hong Kong SAR (–5.6%); and Indonesia (–3.5%) reported the most substantial declines. Applications in Brazil fell for a fourth consecutive year, while the Russian Federation reported a second successive year of declining numbers of applications. A decline in resident applications was the primary reason for the decrease in total applications for the Russian Federation in 2017, whereas a decline in non-resident applications was the main driver for Brazil; China, Hong Kong SAR; and Indonesia.

Among the top five offices, the Republic of Korea is the only one to report a small drop in applications in 2017 (–1.9%). China (+14.2%) and the EPO (+4.5%) reported strong growth in the number of applications. The IP offices of Japan (+0.03%) and the U.S. (+0.2%) saw negligible growth. The long-term trend shows that the office of China has recorded year-on-year growth for the past 21 years, while the U.S. office has enjoyed eight consecutive years of growth. The Republic of Korea's office enjoyed solid growth in applications for each year from 2010 to 2015, but filings declined by 2.4% in 2016 and by 1.9% in 2017. The patent office of Japan has experienced either a fall in applications or negligible growth since 2005, mainly reflecting a persistent fall in resident applications. Since 2010, the EPO has experienced fluctuation in the number of applications received – growth in filings in one year is followed by a drop in applications the next year.

Among the offices of low- and middle-income countries, Ecuador (+11.5%), Romania (+10.8%) and Colombia (+7.7%) recorded particularly rapid growth in 2017. Growth in non-resident applications was the main driver

of total growth in Colombia and Ecuador, while resident applications were the main driver in Romania (see figure A11). Two of the three regional offices – the African Intellectual Property Organization (OAPI), the African Regional Intellectual Property Organization (ARIPO) and the Eurasian Patent Organization (EAPO) – have seen applications return to growth following a fall during two successive years. Applications filed at ARIPO grew by 7.2% in 2017, while OAPI reported a 2.6% increase. In contrast, EAPO saw three consecutive years of declines in filings. At most offices of low- and middle-income countries, the bulk of applications are filed by non-residents. As a result, overall increases or decreases in applications received by these offices are determined mainly by the filing behavior of non-resident applicants.

Offices located in Asia received 65% of all applications filed worldwide in 2017

Offices located in Asia received around 2.1 million applications in 2017, representing 65.1% of the world total (see figure 1.3). The combined total of Europe and North America was just below the 1 million mark. Asia's share of all applications filed worldwide increased from 49.7% in 2007 to 65.1% in 2017, primarily driven by strong growth in filings in China, which accounted for around two-thirds of all applications filed in the region. Offices in North America accounted for just over one-fifth of the 2017 world total, while those in Europe accounted for just over one-tenth. The combined share for Africa, LAC and Oceania was 3.4%. The shares of all world regions except Asia have gradually declined over the past decade due to the rapid growth in applications filed in China.

Offices located in Asia received 65.1% of all patent applications filed worldwide

1.3. Patent applications by region, 2007 and 2017

Source: Table A6.

Patent filings since 1883

From 1883 to 1963, the patent office of the U.S. was the leading office for world filings. Application numbers in Japan and the U.S. were stable until the early 1970s, when Japan began to see rapid growth – a pattern also observed for the U.S. from the 1980s onward. Among the top five offices, Japan surpassed the U.S. in 1968 and maintained the top position until 2005. Since the early 2000s, however, the number of applications filed in Japan has followed a downward trend. Both the EPO and the Republic of Korea have seen increases each year since the early 1980s, as has China since 1995. China surpassed the EPO and the Republic of Korea in 2005, Japan in 2010 and the U.S. in 2011 – and it now receives the largest number of applications worldwide. There has been a gradual upward trend in the combined share of the top five offices in the world total – from 75.2% in 2007 to 84.5% in 2017.

Trend in patent applications for the top five offices, 1883–2017

Note: The IP office of the Soviet Union, not represented in this figure, was the leading office in the world in terms of filings from 1964 to 1969. Like Japan and the U.S., the office of the Soviet Union saw stable application numbers until the early 1960s, after which it recorded rapid growth in the number of applications filed.

Source: Figure A7.

The distribution of applications by income group shows that offices of high-income countries received 49.1% of all applications filed worldwide in 2017, which is one percentage point above the share received by offices of upper middle-income countries (48.1%) (see table A5). However, there has been a sizeable shift in distribution of applications toward the upper middle-income group, which is largely explained by the strong growth in filings in China and the decline in Japan. The share for offices of upper middle-income countries rose from 19.9% in 2007 to 48.1% in 2017, while that of the high-income group declined from 76.4% to 49.1% over the same period. The combined share of the low- and lower middle-income groups was 2.8% in 2017, which is identical to their share in 2016.

Equivalent application count

Applications at regional IP offices are equivalent to multiple applications in the countries that are members of the organizations establishing those offices. In particular, to calculate the number of equivalent applications for the African Intellectual Property Organization (OAPI), the Eurasian Patent Organization (EAPO) and the Patent Office of the Cooperation Council for the Arab States of the Gulf (GCC Patent Office), each application is multiplied by the corresponding number of member states. For African Regional Intellectual Property Organization (ARIPO) and the European Patent Office (EPO) data, each application is counted as one application abroad if the applicant does not reside in a member state or as one resident application and one application abroad if the applicant resides in a member state. The equivalent application concept is used for reporting data by origin.

Residents of the U.S. filed more than 230,000 patent applications abroad

Applications received by offices from resident and non-resident applicants are referred to as office data, whereas applications filed by applicants at a national/regional office (resident applications) or at foreign offices (applications abroad) are referred to as origin data. Here, patent statistics based on the origin of residence of the first named applicant are reported in order to complement the picture of patent activity worldwide.

Applicants from China filed around 1.31 million equivalent patent applications in 2017, which is more than the combined total for applicants from Japan (460,660), the Republic of Korea (226,568) and the U.S. (524,835). Those four origins, plus Germany (176,235), accounted for the bulk of the global total (see map 1.4). China has been the largest source of patent applications since 2012, when it surpassed Japan. However, it should be noted that only 4.6% of all applications from China are

filed abroad, while 95.4% are filed in China. In contrast, filings abroad constitute 43.5% of total applications from Japan and 44% from the U.S.

Twelve of the top 20 origins are located in Europe. Their combined total (518,480 equivalent applications) is slightly lower than that from U.S.-based applicants. All top 20 origins, with the exception of China, India, the Islamic Republic of Iran and the Russian Federation, are high-income countries. Among the top 20 origins, Denmark (+9.6%), India (+8.3%) and Belgium (+6.1%) recorded the fastest growth in 2017 (see figure A18). For both Belgium and Denmark, growth in applications abroad was the main source of overall growth, while for India growth in resident applications was the main driver of overall growth.

Among the large middle-income origins, Indonesia (+101%) and Turkey (+33%) saw the fastest growth in filings in 2017. Malaysia (+9.4%), South Africa (+8.3%), Mexico (+5%) and Brazil (+4%) also saw relatively strong growth in 2017. The overall growth in Brazil, Indonesia, South Africa and Turkey was due to increases in resident applications, while growth in equivalent applications abroad drove overall growth in Malaysia and Mexico.

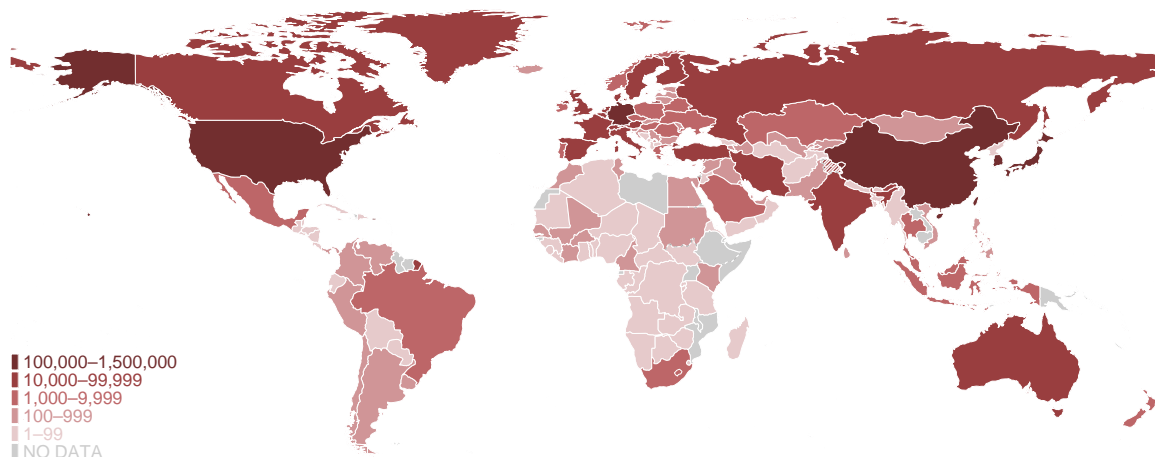

Filing abroad reflects the globalization of IP protection and a desire to commercialize technology in foreign markets. The costs of filing abroad can be substantial, so the patents for which applicants seek international protection are likely to confer higher values. Among the top 20 origins, applications filed abroad made up for more than three-quarters of the totals for Belgium (77%), Canada (83.1%), Israel (90.7%), the Netherlands (75.3%), Sweden (75.3%) and Switzerland (80.6%). However, in absolute numbers, the U.S. had the most, with 230,931, followed by Japan (200,370), Germany (102,890), the Republic of Korea (67,484) and China (60,310). China, the Republic of Korea and the U.S. saw growth in applications abroad over the past five years, whereas the trend in applications abroad for Germany and Japan was stable over the same period.

High-income origins, such as Ireland (85.2%), Liechtenstein (69%), Luxembourg (79.3%), Norway (71.7%) and Singapore (76.8%), have a high proportion of applications abroad as a share of total applications. Applications abroad accounted for a small percentage of total applications for Brazil (27%), Colombia (24.1%) and Turkey (18.5%).

U.S. applicants accounted for more than half of all non-resident applications filed in Canada (52.8%), Israel (51%), Mexico (52.8%) and Norway (75.3%). Applicants residing in Japan accounted for at least a third of all non-resident applications filed in Germany (36.5%), Indonesia (34.2%), the Republic of Korea (32.9%) and

China, Germany, Japan, the Republic of Korea and the U.S. were the five largest sources of patent applications

1.4 Equivalent patent applications by origin, 2017

Source: Map A17.

Thailand (49%). German applicants accounted for a high share in France (24.7%) and Italy (31%), while applicants from China accounted for a high proportion of non-resident filings in Luxembourg (66.8%) and the United Kingdom (U.K.) (12.3%).

Patent applications for unique inventions grew by 9.7% to reach 1.56 million worldwide

Patent applicants traditionally file at their national offices and then subsequently abroad. This means that some inventions are recorded more than once. To take this into account, WIPO has developed indicators for patent families, and the trend in patent families mirrors that for patent applications. The total number of patent families worldwide increased from around 780,000 in 2001 to around 1.56 million in 2015 (see figure 1.5). Applicants from China accounted for more than half of all patent families (52.2%) in 2015, followed by Japan (14.6%), the U.S. (10.4%) and the Republic of Korea (8.9%). China's share of the world total more than doubled between 2010 (25.2%) and 2015 (52.2%), while the share of Japan, the Republic of Korea and the U.S. declined over the same period – with Japan seeing the sharpest drop from 26.2% in 2010 to 14.6% in 2015.

Half of all applications were first filing, the other half repeat filings, mostly at foreign offices

1.5. Patent applications and patent families worldwide, 2001–2017

Sources: Figures A1 and A23.

For the past two decades (1995–2015), the ratio of families to applications has remained more or less stable at around 0.54. This means that just over half of all applications are initial filings and the others repetitive filings, mostly at foreign offices. Belgium (0.17), Denmark (0.18), Norway (0.19) and Switzerland (0.16) have low family-to-application ratios for the period from 2012 to 2014 – indicating substantial duplication due to high numbers of cross-border filings. Conversely, China (0.8), Poland (0.7) and the Russian Federation (0.8) have high ratios, indicating less duplication due to low numbers of cross-border filings.

Patent families

A patent family is a set of interrelated patent applications filed in one or more offices to protect the same invention. The patent applications in a family are inter-linked by one or more of the following: priority claim, Patent Cooperation Treaty (PCT) national phase entry, continuation, continuation-in-part, internal priority and addition or division. A special subset comprises foreign-oriented patent families – that is, those patent families that have at least one filing office which differs from the office of the applicant's country of origin.

Some foreign-related patent families include only one filing office because applicants may choose to file only with a foreign office. For example, if a Canadian applicant files a patent application directly with the United States Patent and Trademark Office (USPTO) without having previously filed with the patent office of Canada, that patent family will constitute a foreign-oriented patent family with just one office.

The size of patent families (i.e., the number of offices) reflects their geographical coverage. Around 83% of patent families created worldwide between 2013 and 2015 were filed in a single office. There is considerable variation among top origins, however. For example, around two-fifths of all patent families originating from the Netherlands, Sweden and Switzerland cover a single office, whereas single-office patent families account for around 98% of all families for China and the Russian Federation (see figure A24). Focusing exclusively on foreign-oriented patent families shows that the U.S. (154,216) created the largest number of such families between 2013 and 2014, followed by Japan (144,512), the Republic of Korea (58,537), Germany (57,007) and China (35,084) (see figure A26).

Canon Inc. of Japan created the largest number of patent families worldwide

Canon Inc. of Japan created 24,006 patent families between 2013 and 2015, followed by Samsung Electronics (21,836) of the Republic of Korea and the State Grid Corporation of China (21,635). Eight of the top 10 companies are located in Asia. International Business Machines of the U.S. (14,972), ranked fifth, and Robert Bosch of Germany (12,598), ranked 10th, are the only two non-Asian applicants in the top 10 list (see table A27).

The highest shares of Canon's patent families created during this period relate to optics technology (27.5%), audio-visual technology (16.6%) and computer technology (14.7%). Computer technology (26.1%) accounted for the highest share of families belonging to

Samsung Electronics, followed by digital communication (15.9%) and semiconductors (11.9%). For the State Grid Corporation of China, electrical machinery (31.2%) was the most important technology field, followed by measurement (21.3%) and IT methods for management (8.1%).

The top 50 list is comprised of applicants located in just five countries. Japan heads the list with 20 companies, followed by China (13), the Republic of Korea (7), the U.S. (6) and Germany (4). The top 50 list mainly comprises multinational companies. However, five Chinese universities – Harbin Institute of Technology (7,274), Shanghai Jiao Tong University (5,058), Southeast University (6,074), Tsinghua University (5,363) and Zhejiang University (8,108) – also feature.

Three Asian countries – the Republic of Korea, China and Japan – filed the highest number of patents per unit of GDP

Variations in patenting activity across countries reflect differences in their levels of economic growth and development. It is therefore informative to examine resident patent activity with regard to population, R&D spending, GDP and other variables. These are commonly referred to as “patent activity intensity” indicators.

Since 2004, the Republic of Korea has had the highest number of patent applications per unit of USD 100 billion GDP. However, its ratio of resident applications to GDP for the past four years shows a year-on-year decrease. China has the second highest ratio, followed by Japan, Germany and Switzerland (see figure 1.6). Over the past 10 years, the gap between China and the Republic of Korea has narrowed. Reflecting strong growth in resident applications, China's resident applications per unit of GDP increased from 1,594 in 2007 to 5,869 in 2017. In contrast, Japan's ratio fell from 7,100 in 2007 to 5,264 in 2017. Germany's ratio declined slightly, from 2,194 to 1,961, while that of Switzerland remained stable at around 1,774.

The list of the top 20 origins is predominantly comprised of high-income countries. However, four middle-income countries – China, the Islamic Republic of Iran, the Russian Federation and Ukraine – also feature (see figure A39). The rank of the top 20 origins has been stable for the past 10 years, with little movement in country rankings, except in the case of China.

Among the large middle-income origins, Turkey's resident patent application to GDP ratio (448) is far above that of Brazil (186), India (174) and South Africa (104), all of which, with the exception of South Africa, reported a higher ratio for 2017 compared to 2007.

The Republic of Korea had the highest number of patent applications per unit of GDP

1.6. Resident patent applications per USD 100 billion GDP for the top 10 origins, 2007 and 2017

Source: Figure A39.

The profile of resident applications per million population is similar to that adjusted by GDP, but shows some subtle differences. The Republic of Korea retains its lead, Japan ranks second and Switzerland is ranked third, ahead of the U.S., China and Germany (see figure A40).

Small high-income countries of origin, such as Denmark, Finland, Norway and Singapore, rank highly when resident patent applications are adjusted by population or GDP. Most of the top origins have improved their resident patent application to GDP and population ratios between 2007 and 2017; however, there are a few exceptions, notably Finland, Japan and the U.K., whose ratios have declined.

Computer technology remains the most frequently featured technology field in applications

In 2016 – the latest year for which complete data are available due to the delay between application and publication – computer technology was the most frequently featured technology in published patent applications worldwide with around 198,400 published applications (see table A31). It was followed by electrical machinery (185,600), digital communication (134,000), measurement (129,400) and medical technology (118,700). These five fields accounted for 28.9% of all published applications worldwide.

Among the top 20 technology fields, food chemistry (+12.5%), materials and metallurgy (+8.8%) and digital communication (+8.5%) witnessed the fastest average annual growth between 2006 and 2016. All of the top 20 technology fields saw growth in published applica-

tions between 2006 and 2016, with the exceptions of audio-visual technology (-2.0%) and optics (-1.1%), both of which saw a slight decline.

Among the top 10 origins in the period from 2014 to 2016, China and the Republic of Korea filed most heavily in electrical machinery and computer technology (see figure A32); Japan in electrical machinery; France and Germany in transport; Switzerland and the U.K. in pharmaceuticals; the Netherlands in medical technology; the Russian Federation in food chemistry; and the U.S. in computer technology. The combined share of the top three technologies for the top 10 origins ranged from 19.3% for the U.K. to 29% for the Russian Federation.

Among the large middle-income countries in the period from 2014 to 2016, applicants residing in India (15.7% of total published applications) and Mexico (11.1%) filed most heavily in pharmaceuticals; Brazil (6.5%) in other special machines; Malaysia (8.9%) in computer technology; South Africa (6.3%) in civil engineering and Turkey (11.4%) in other consumer goods. Bermuda (15%) and Singapore (11.5%) – two high-income countries – filed mainly in computer technologies.

The following four areas are categorized as energy-related technologies: solar energy, fuel cell technology, wind energy technology and geothermal energy. The number of published patent applications worldwide for energy-related technologies underwent a substantial increase – from around 14,500 in 2002 to around 42,800 in 2012. However, since then there has been a marked downward trend in energy-related published patent applications, which decreased from 42,800 in 2012 to 32,700 in 2016 (see figure A33).

The office of India granted 50% more patents in 2017 than in 2016

Offices carry out a formal and substantive examination to decide whether or not to issue a patent. The procedure for granting a patent varies between offices, and differences in the numbers of granted patents among offices depend on factors such as examination capacity and procedural delays. For this reason, application data for a given year should not be compared with grant data from the same year.

In 2017, an estimated 1.4 million patents were granted worldwide, up 3.9% on 2016 figures, and represent 17 consecutive years of growth (see figure 1.7). China (420,144) issued the largest number of patents in 2017, followed by the U.S. (318,829), Japan (199,577), the Republic of Korea (120,662) and the EPO (105,645). These five offices issued more than 1.16 million patents between them – 83% of the world total.

Among the top 10 offices, India granted 50.2% more patents in 2017 than in 2016, with grants increasing from 8,248 in 2016 to 12,387 in 2017. Non-resident grants accounted for 85% of the total increase. The EPO (+10.1%) and the Republic of Korea (+10.8%) also exhibited double-digit growth in 2017. For the EPO, this is the second successive year of double-digit growth. The office of the U.S. (+5.2%) also saw strong growth in 2017. Following three successive years of strong growth, China reported modest growth of 3.9% in 2017.

Beyond the top 10 list, Mexico granted 8,510 patents in 2017. Brazil (5,450), Malaysia (5,063) and South Africa (5,535) each issued more than 5,000 patents. Thailand issued 3,080 patents in 2017, which is 67.6% higher than the total for the previous year. All these offices, except Mexico, saw strong annual growth in patent grants.

Asia's share of worldwide patent grants was 57.2% in 2017, which is similar to its 2016 share. However, its share of grants has gradually followed an upward trend over the past 10 years – increasing from 53.5% in 2007 to 57.2% in 2017. Offices located in North America accounted for 24.4% of patent grants worldwide in 2017, while offices in Europe accounted for 14.5% of the world total. The combined share for Africa, LAC and Oceania was 3.9%.

The number of patents in force in the U.S. amounted to 2.98 million in 2017

Patent rights generally last for up to 20 years from the date the application was filed. The estimated number of patents in force worldwide rose from 8.5 million in 2008 to 13.7 million in 2017. In 2017, the largest

Patent granted worldwide grew by 3.9%

1.7. Patent grants worldwide, 2001–2017

Source: Figure A3.

number of patents in force was recorded in the U.S. (2.98 million). China (2.09 million) and Japan (2.01 million) each had around 2 million patents and the U.K. (1.24 million) and Republic of Korea (970,889); these countries make up the top five jurisdictions (see figure 1.8). Among the top five offices, China recorded the fastest growth between 2010 and 2017, with 20.5% average annual growth. The Republic of Korea (+6.1%), the U.S. (+5.8%) and Japan (+5.1%) exhibited similar growth rates, while the U.K. had close to zero growth (+0.1%). The top 20 list includes 17 offices from high-income countries and three from upper middle-income countries, namely China, Mexico and the Russian Federation (see figure A42).

Holders must pay maintenance/renewal fees to maintain the validity of their patents, and may opt to let a patent lapse before the end of its full term. For the 65 offices that reported their in-force data broken down by year of filing, between 40% and 43% of patents granted remained in force for at least 6 to 10 years after the filing date, and about one-fifth lasted for the full 20 years (see figure A43).

Although patents can be maintained for 20 years, the average age of patents varied across offices. For example, the average age of all patents in force in 2017 in Thailand was 14.2 years, while in China it was 7.2 years. Along with Thailand, India (13 years), Viet Nam (12.2 years) and Chile (12 years) also have high average ages of patents in force (see figure A44).

Half of all patents in force in the U.S. originated from non-resident applicants

1.8. Patents in force at the top 10 offices, 2017

Source: Figure A42.

More than 75% of applications examined in 2017 resulted in patents being granted at the offices of Australia and the Russian Federation

Patent offices examine applications and decide whether or not to grant patent rights. Examination processes differ across offices, which makes cross-country comparisons difficult. However, every effort has been made to compile examination outcome data based on common definitions and concepts. More than 75% of applications examined in 2017 resulted in patents being granted at the patent offices of Australia and the Russian Federation. Japan also had a high share of patents granted for applications processed. Among the 10 selected offices, Germany, India, the U.K. and the U.S. granted patents for fewer than half of all applications processed in 2017 (see figure 1.9). The shares of rejected applications were the highest in the U.K. and the U.S., while India reported the highest share of those withdrawn.

The offices of China and the U.S. each had more than one million potentially pending patent applications in 2017

Patent offices must assess whether the claims in applications meet the standards of novelty, non-obviousness and industrial applicability defined in national laws. Processing patents therefore consumes time and resources. The total number of potentially pending applications worldwide stood at 5.7 million in 2017. This estimate is based on data from 108 offices. For the first time, pending applications data is available from the IP office of China.

The IP office of China had the largest number of potentially pending applications (1.11 million) in 2017 (see figure A46). It was followed by the U.S. (1.08 million), Japan (815,295) and the EPO (652,427). Most of those offices had fewer potentially pending applications in 2017 compared to 2016. For China, no data prior to 2017 are available. Among selected middle-income countries, Brazil and India each reported more than 200,000 potentially pending applications in 2017. However, Brazil had 7.2% fewer pending applications in 2017 compared to the previous year, while India saw a 6.7% drop.

Potentially pending applications

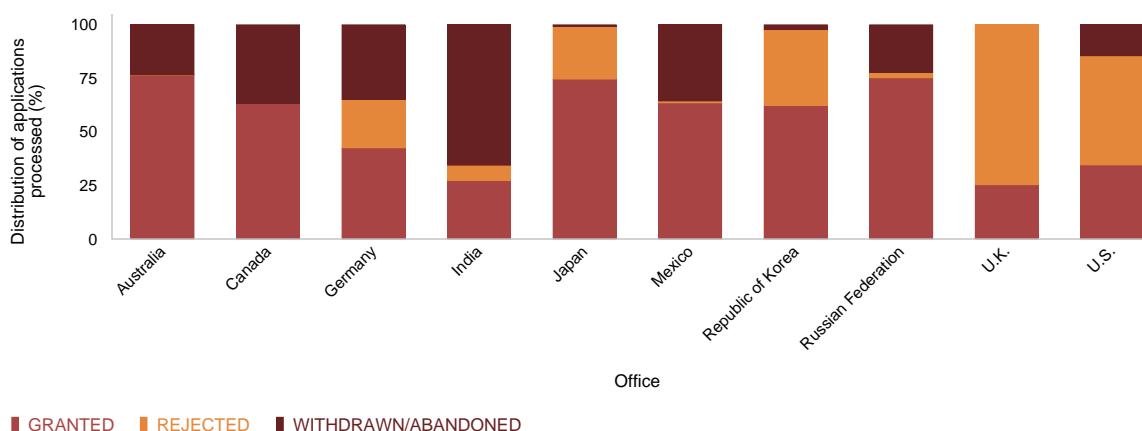

Potentially pending applications include all patent applications, at any stage in the process, awaiting a final decision by a patent office, including those applications for which applicants have not filed a request for examination (where applicable).

China and Japan drive PCT international patent application filings to record heights

An international treaty administered by WIPO, the Patent Cooperation Treaty (PCT), allows applicants to seek patent protection for an invention simultaneously in a large number of countries by filing a single PCT international application. The granting of patents remains under the control of national and regional patent offices and is carried out in what is called the “national phase” or “regional phase.”

The shares of rejected applications were highest in the U.K. and the U.S.

1.9. Distribution of patent examination outcomes for selected offices, 2017

Source: Figure A45.

Overall, inventors from around the world filed around 243,500 PCT applications in 2017 – 4.5% more than the previous year, driven by strong growth from China and Japan. China, with 48,900 PCT applications, became the second largest source of PCT applications, closing in on the long-time leader – the U.S. (56,680). Japan (48,206) ranked third, followed by Germany (18,948) and the Republic of Korea (15,752) (see figure A51).

Among the top 20 origins, Belgium (+11.1%) and China (+13.5%) were the only two countries to have recorded double-digit annual growth in 2017. China has now posted growth higher than 10% every year since 2003. Sweden (+6.9%), Japan (+6.6%) and Denmark (+5.4%) also saw strong growth. In contrast, Spain (–5.9%), the Netherlands (–5.3%) and Italy (–4.1%) each saw a decrease in filings.

The share of PCT applications with women inventors is rising

In 2017, 31.2% of PCT applications contained at least one woman inventor, which is a considerably higher figure than the 22.1% recorded in 2003. In terms of volume, the total number of PCT applications with at least one woman inventor has almost tripled, from 24,004 in 2003 to 68,270 in 2017.

Women's participation rate varied across countries. Among the top 20 origins, the Republic of Korea (50.3%) and China (47.9%) had the highest women's participation rates (see figure A36). Belgium (35.7%), Spain (35.4%), the U.S. (32.8%) and France (32.5%) also had relatively high shares of PCT applications

by women inventors. However, the share of women inventors in total inventors is low, ranging from 28.9% in China to 9.1% in Japan (see figure A37).

Fields of technology related to life sciences had comparatively high shares of PCT applications with women inventors in 2017. More than half of PCT applications in the fields of biotechnology (58.3%), pharmaceuticals (56.3%), organic fine chemistry (55.1%), food chemistry (50.7%) and analysis of biological materials (50.6%) included at least one women inventor (see figure A38).

Around 1.76 million utility model applications were filed worldwide in 2017

A utility model is a special form of patent right granted by a state or jurisdiction to an inventor or the inventor's assignee for a fixed period of time. The terms and conditions for granting a utility model differ slightly from those for normal patents, including a shorter term of protection and less stringent eligibility requirements.

In 2017, the total number of utility model applications worldwide reached 1.76 million. The IP office of China received 95.8% of the world total – the remaining 74 offices accounted for just 4.2%. As with invention patents, the IP office of China revised its method of compiling utility model applications statistics in 2017, now counting only those applications for which the office has received the necessary application fees. Due to this break in the data series and to the large number of filings in China, it is not possible to calculate the growth rate for the world total and China.

The IP office of China received 1.69 million applications in 2017 (see figure A55), followed by Germany (13,301), the Russian Federation (10,643), Ukraine (9,108), the Republic of Korea (6,811) and Japan (6,105). Among the top 20 offices, the Philippines (+22.8%), Kazakhstan (+16.3%) and Finland (+13.1%) witnessed double-digit growth in 2017 – albeit from a low base. In contrast, the number of applications filed in Mexico (–12.9%), Austria (–12.4%), Poland (–12.4%) and the Republic of Korea (–12.3%) fell sharply in 2017.

Patent applications in relation to GDP and population	61
A39. Resident patent applications per USD 100 billion GDP for the top 20 origins, 2007 and 2017	61
A40. Resident patent applications per million population for the top 20 origins, 2007 and 2017	61
Patents in force	62
A41. Trend in patents in force worldwide, 2008–2017	62
A42. Patents in force at the top 20 offices, 2017	62
A43. Patents in force in 2017 as a percentage of total applications	63
A44. Average age of patents in force at selected offices, 2012 and 2017	63
Patent office procedural data	64
A45. Distribution of patent examination outcomes for selected offices, 2017	64
A46. Potentially pending applications at the top 20 offices, 2017	64
A47. Average pendency times for first office action and final decision at selected offices, 2017	65
A48. Average years of experience of patent examiners for selected offices, 2017	65
Patent applications filed through the Patent Cooperation Treaty (PCT) System	66
A49. Trend in PCT applications, 2002–2017	66
A50. PCT applications by origin, 2017	66
A51. PCT applications for the top 20 origins, 2017	67
Patent prosecution highway (PPH)	68
A52. PPH requests by office of first filing and offices of later examination, 2017	68
A53. Flows of PPH requests between offices of first filing and offices of later examination, 2017	69
Utility model applications	70
A54. Trend in utility model applications worldwide, 2003–2017	70
A55. Utility model applications for the top 20 offices, 2017	70
A56. Utility model applications for offices of selected low- and middle-income countries, 2017	71
Microorganisms	72
A57. Trend in microorganism deposits worldwide, 2003–2017	72
A58. Deposits at the top international depositary authorities, 2017	72
Statistical tables	73
A59. Patent applications by office and origin, 2017	73
A60. Patent grants by office and origin, and patents in force, 2017	78
A61. Patent office procedural data, 2017	82
A62. Utility model applications and grants by office and origin, 2017	84

Patent applications and grants worldwide

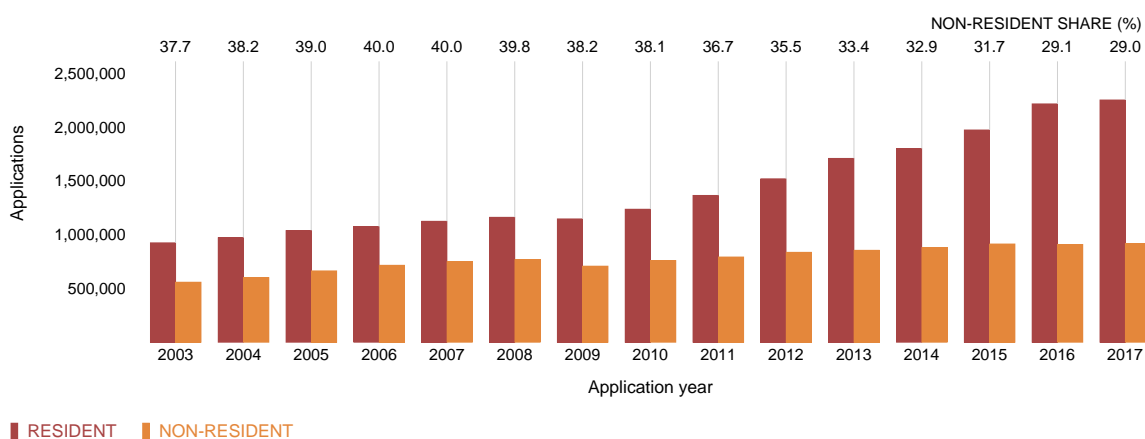

A1. Trend in patent applications worldwide, 2003–2017

Note: China's 2017 data are not comparable with its previous years' data due to the new way in which the IP office of China now counts its applications data. Prior to 2017, it included all applications received; however, starting in 2017, China's application count data include only those applications for which the office has received the necessary application fees. Due to this break in the data series and to the large number of filings in China, it is not possible to report an accurate 2017 growth rate at world level (see the data description section). World totals are WIPO estimates using data covering 156 patent offices. These totals include applications filed directly with national and regional offices and applications entering offices through the Patent Cooperation Treaty national phase (where applicable).

Source: WIPO Statistics Database, September 2018.

A2. Resident and non-resident patent applications worldwide, 2003–2017

Note: World totals are WIPO estimates using data covering 156 patent offices. These totals include applications filed directly with national and regional offices and applications entering offices through the Patent Cooperation Treaty national phase (where applicable). See the glossary for definitions of resident and non-resident.

Source: WIPO Statistics Database, September 2018.

A3. Trend in patent grants worldwide, 2003–2017

Note: World totals are WIPO estimates using data covering 155 patent offices. These totals include patent grants based on applications filed directly with national and regional offices and patents granted by offices on the basis of the Patent Cooperation Treaty national phase (where applicable).
Source: WIPO Statistics Database, September 2018.

A4. Resident and non-resident patent grants worldwide, 2003–2017

Note: World totals are WIPO estimates using data covering 155 patent offices. These totals include patent grants based on applications filed directly with national and regional offices and patents granted by offices on the basis of the Patent Cooperation Treaty national phase (where applicable). See the glossary for definitions of resident and non-resident.
Source: WIPO Statistics Database, September 2018.

Patent applications and grants by office

A5. Patent applications by income group, 2007 and 2017

Income group	Number of applications		Resident share (%)		Share of world total (%)		Average growth (%)
	2007	2017	2007	2017	2007	2017	2007–2017
High-income	1,433,000	1,555,600	62.7	58.6	76.4	49.1	0.8
Upper middle-income	372,300	1,524,400	55.4	85.8	19.9	48.1	15.1
Lower middle-income	61,300	78,900	20.8	30.0	3.3	2.5	2.6
Low-income	8,400	10,000	86.5	83.1	0.4	0.3	1.8
World	1,875,000	3,168,900	60.0	71.0	100.0	100.0	5.4

Note: China's 2017 data are not comparable with its previous years' data due to the new way in which the IP office of China now counts its applications data. Prior to 2017, it included all applications received; however, starting in 2017, China's application count data include only those applications for which the office has received the necessary application fees (see the data description section). Although there is a break in the data series, the average growth rate for 2007–2017 is reported because this change in method has a limited impact on the long-term growth rate. Totals by income group are WIPO estimates using data covering 156 offices. Each category includes the following number of offices: high-income countries/economies (58), upper middle-income (47), lower middle-income (32) and low-income (19). European Patent Office data are allocated to the high-income group because most of its member states are high-income countries. For similar reasons, data for the African Regional Intellectual Property Organization and the African Intellectual Property Organization are allocated to the low-income group, while those for the Eurasian Patent Organization are allocated to the lower middle-income group. For information on income group classification, see the data description section.

Source: WIPO Statistics Database, September 2018.

A6. Patent applications by region, 2007 and 2017

Region	Number of applications		Resident share (%)		Share of world total (%)		Average growth (%)
	2007	2017	2007	2017	2007	2017	2007–2017
Africa	14,100	16,000	13.9	17.6	0.8	0.5	1.3
Asia	932,500	2,062,500	69.6	83.7	49.7	65.1	8.3
Europe	339,300	355,700	63.7	59.9	18.1	11.2	0.5
Latin America and the Caribbean	58,100	57,600	11.4	15.1	3.1	1.8	-0.1
North America	496,300	642,000	49.6	46.4	26.4	20.3	2.6
Oceania	34,700	35,100	13.3	10.0	1.9	1.1	0.1
World	1,875,000	3,168,900	60.0	71.0	100.0	100.0	5.4

Note: China's 2017 data are not comparable with its previous years' data due to the new way in which the IP office of China now counts its applications data. Prior to 2017, it included all applications received; however, starting in 2017, China's application count data include only those applications for which the office has received the necessary application fees (see the data description section). Although there is a break in the data series, the average growth rate for 2007–2017 is reported because this change in method has a limited impact on the long-term growth rate. Totals by geographic region are WIPO estimates using data covering 156 offices. Each region includes the following number of offices: Africa (31), Asia (43), Europe (45), Latin America and the Caribbean (31), North America (2) and Oceania (4).

Source: WIPO Statistics Database, September 2018.

A7. Trend in patent applications for the top five offices, 1883–2017

Note: China's 2017 data are not comparable with its previous years' data due to the new way in which the IP office of China now counts its applications data. Prior to 2017, it included all applications received; however, starting in 2017, China's application count data include only those applications for which the office has received the necessary application fees. EPO is the European Patent Office. The top five offices were selected based on their 2017 totals.

Source: WIPO Statistics Database, September 2018.

A8. Patent applications at the top 20 offices, 2017

Note: EPO is the European Patent Office. In general, national offices of the EPO member states receive lower volumes of applications because applicants may apply via the EPO to seek protection within any EPO member state.

Source: WIPO Statistics Database, September 2018.

A9. Contribution of resident and non-resident applications to total growth for the top 20 offices, 2016–2017

.. indicates not available.

Note: * indicates China's 2017 data are not comparable with its previous years' data due to the new way in which the IP office of China now counts its applications data. Prior to 2017, it included all applications received; however, starting in 2017, China's application count data include only those applications for which the office has received the necessary application fees (see the data description section). Due to this break in the data series, it is not possible to report an accurate 2017 growth rate. EPO is the European Patent Office. This figure shows total growth or decrease in applications at each office, broken down by the respective contributions of resident and non-resident applications. For example, applications filed at the EPO grew by 4.5%. Growth in resident applications accounted for 1.6 percentage points of this increase, whereas the remaining 2.9 percentage points reflected growth in non-resident applications.

Source: WIPO Statistics Database, September 2018.

A10. Patent applications at offices of selected low- and middle-income countries, 2017

Note: ARIPO is the African Regional Intellectual Property Organization, EAPO is the Eurasian Patent Organization and OAPI is the African Intellectual Property Organization. The selected offices are from different world regions and income groups (low-income, lower middle-income and upper middle-income). Where available, data for all offices are presented in table A59.

Source: WIPO Statistics Database, September 2018.

A11. Contribution of resident and non-resident applications to total growth for offices of selected low- and middle-income countries, 2016–2017

Note: ARIPO is the African Regional Intellectual Property Organization, EAPO is the Eurasian Patent Organization and OAPI is the African Intellectual Property Organization. The selected offices are from different world regions and income groups (low-income, lower middle-income and upper middle-income). Data for all available offices are presented in the statistical table at the end of this section. This figure shows total growth or decrease in applications at each office, broken down by the respective contributions of resident and non-resident applications. For example, applications filed in South Africa grew by 4.6%. Growth in resident applications accounted for 0.3 percentage points of this increase, whereas the remaining 4.3 percentage points came from growth in non-resident applications.

Source: WIPO Statistics Database, September 2018.

A12. Patent grants by income group, 2007 and 2017

Income group	Number of grants		Resident share (%)		Share of world total (%)		Average growth (%) 2007–2017
	2007	2017	2007	2017	2007	2017	
High-income	615,200	874,800	63.5	56.8	79.2	62.3	3.6
Upper middle-income	128,700	497,700	49.5	72.2	16.6	35.4	14.5
Lower middle-income	27,300	24,500	25.5	17.7	3.5	1.7	-1.1
Low-income	5,100	7,600	87.2	86.2	0.7	0.5	4.1
World	776,300	1,404,600	60.0	61.7	100.0	100.0	6.1

Note: Totals by income group are WIPO estimates using data covering 155 offices. Each category includes the following number of offices: high-income countries/economies (59), upper middle-income (45), lower middle-income (32) and low-income (19). European Patent Office data are allocated to the high-income group because most of its member states are high-income countries. For similar reasons, data for the African Regional Intellectual Property Organization and the African Intellectual Property Organization are allocated to the low-income group, while those for the Eurasian Patent Organization are allocated to the lower middle-income group. For information on income group classification, see the data description section.

A13. Patent grants by region, 2007 and 2017

Region	Number of grants		Resident share (%)		Share of world total (%)		Average growth (%)
	2007	2017	2007	2017	2007	2017	2007-2017
Africa	4,600	9,400	32.0	14.1	0.6	0.7	7.4
Asia	415,200	803,100	69.1	73.8	53.5	57.2	6.8
Europe	149,300	203,600	62.6	57.2	19.2	14.5	3.2
Latin America and the Caribbean	16,600	20,300	6.1	8.3	2.1	1.4	2.0
North America	175,800	342,900	46.3	44.7	22.6	24.4	6.9
Oceania	14,800	25,300	10.6	5.4	1.9	1.8	5.5
World	776,300	1,404,600	60.0	61.7	100.0	100.0	6.1

Note: Totals by geographic region are WIPO estimates using data covering 155 offices. Each region includes the following number of offices: Africa (30), Asia (43), Europe (45), Latin America and the Caribbean (30), North America (2) and Oceania (5).

Source: WIPO Statistics Database, September 2018.

A14. Trend in patent grants for the top five offices, 1883-2017

Note: EPO is the European Patent Office. The top five offices were selected based on their 2017 totals.

Source: WIPO Statistics Database, September 2018.

A15. Patent grants for the top 20 offices, 2017

Note: EPO is the European Patent Office. The procedure for issuing patents varies between offices, and differences in the numbers of patents granted among offices depend on factors such as examination capacity and procedural delays. The examination process can also be lengthy, so there is a time lag between application and grant dates. For this reason, data on applications for a given year should not be compared with data on grants for the same year.

Source: WIPO Statistics Database, September 2018.

A16. Patent grants for offices of selected low- and middle-income countries, 2017

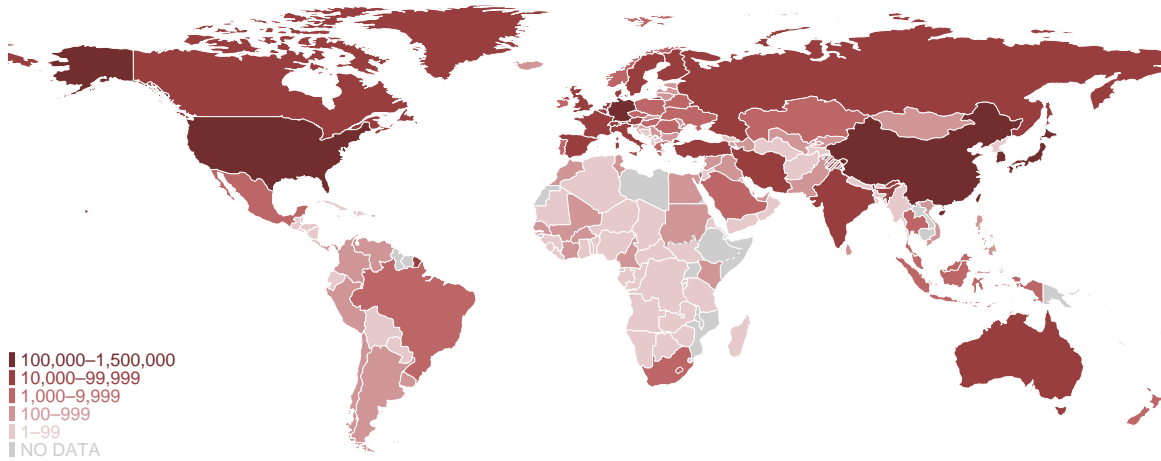

Note: ARIPO is the African Regional Intellectual Property Organization, EAPO is the Eurasian Patent Organization and OAPI is the African Intellectual Property Organization. The selected offices are from different world regions and income groups (low-income, lower middle-income and upper middle-income). Where available, data for all offices are presented in table A60.

Source: WIPO Statistics Database, September 2018.

Patent applications and grants by origin

A17. Equivalent patent applications by origin, 2017

Note: Patent filing activity by origin includes resident applications and applications filed abroad. The origin of a patent application is determined by the residence of the first named applicant. Applications filed at regional offices are considered equivalent to multiple applications in the relevant member states. See the glossary for the definition of equivalent application.

Source: WIPO Statistics Database, September 2018.

A18. Equivalent patent applications for the top 20 origins, 2017

.. indicates not available.

Note: * indicates China's 2017 data are not comparable with its previous years' data due to the new way in which the IP office of China now counts its applications data. Prior to 2017, it included all applications received; however, starting in 2017, China's application count data include only those applications for which the office has received the necessary application fees (see the data description section). Due to this break in the data series, it is not possible to report an accurate 2017 growth rate. Patent activity by origin includes resident applications and applications filed abroad. The origin of a patent application is determined by the residence of the first named applicant. Applications filed at regional offices are considered equivalent to multiple applications in the relevant member states. See the glossary for the definition of equivalent application.

A22. Equivalent patent grants for the top 20 origins, 2017

Note: See the glossary for the definition of equivalent grant.
Source: WIPO Statistics Database, September 2018.

Patent families

A23. Trend in patent families worldwide, 2001–2015

Note: Applicants often file patent applications in multiple jurisdictions, so some inventions are recorded more than once. To take this into account, WIPO has indicators related to patent families, defined as patent applications interlinked by one or more of the following: priority claim, Patent Cooperation Treaty national phase entry, continuation, continuation-in-part, internal priority and addition or division. Patent families here include only those associated with patent applications for inventions and exclude patent families associated with utility model applications.

Sources: WIPO Statistics Database and EPO PATSTAT database, September 2018.

A24. Distribution of patent families by number of offices for the top 20 origins, 2013–2015

Note: A patent family is defined as patent applications interlinked by one or more of the following: priority claim, Patent Cooperation Treaty national phase entry, continuation, continuation-in-part, internal priority and addition or division. Patent families here include only those associated with patent applications for inventions and exclude patent families associated with utility model applications.

Sources: WIPO Statistics Database and EPO PATSTAT database, September 2018.

A25. Trend in foreign-oriented patent families worldwide, 2000–2014

■ FOREIGN-ORIENTED PATENT FAMILIES ■ GROWTH RATE (%)

Note: A special subset of patent families comprises foreign-oriented patent families: this includes only patent families that have at least one filing office that differs from the office of the applicant's country of origin. Some foreign-oriented patent families include only one filing office, because applicants may choose to file directly with a foreign office. For example, if a Canadian applicant files a patent application directly with the United States Patent and Trademark Office (USPTO) without previously filing with the patent office of Canada, that application and applications filed subsequently with the USPTO will form a foreign-oriented patent family.

Sources: WIPO Statistics Database and EPO PATSTAT database, September 2018.

A26. Foreign-oriented patent families for the top 20 origins, 2013–2014

Sources: WIPO Statistics Database and EPO PATSTAT database, September 2018.

A27. Top 50 patent applicants worldwide, based on total number of patent families, 2013–2015

Applicant	Origin	2013	2014	2015	Total number of patent families 2013–2015
CANON INC.	Japan	7,834	8,316	7,856	24,006
SAMSUNG ELECTRONICS CO., LTD.	Republic of Korea	7,642	7,608	6,586	21,836
STATE GRID CORPORATION OF CHINA	China	6,875	9,491	5,269	21,635
MITSUBISHI ELECTRIC CORP.	Japan	5,415	5,095	4,767	15,277
INTERNATIONAL BUSINESS MACHINES CORPORATION	U.S.	4,611	4,487	5,874	14,972

Note: A patent family is defined as patent applications interlinked by one or more of the following: priority claim, Patent Cooperation Treaty national phase entry, continuation, continuation-in-part, internal priority and addition or division. Patent families here include only those associated with patent applications for inventions and exclude patent families associated with utility model applications.

A32. Distribution of published patent applications by technology field for the top 10 origins, 2014–2016

Field of technology	Origin									
	China	U.S.	Japan	Republic of Korea	Germany	France	U.K.	Switzerland	Russian Federation	Netherlands
Electrical machinery, apparatus, energy	6.7	4.6	10.7	9.2	9.1	6.3	5.9	4.3	3.6	7.6
Audio-visual technology	2.1	3.0	5.0	5.6	1.5	2.4	1.7	1.0	0.6	3.0
Telecommunications	1.8	2.4	2.5	3.1	0.9	2.2	1.8	0.6	1.3	1.3
Digital communication	5.1	7.3	2.9	6.3	1.6	5.7	3.6	1.2	0.7	2.4
Basic communication processes	0.4	0.9	0.9	0.6	0.6	0.6	0.6	0.4	0.8	0.8
Computer technology	6.8	12.7	6.3	9.1	3.1	5.6	6.3	2.6	2.6	6.1
IT methods for management	1.2	3.2	1.1	3.3	0.4	1.0	1.5	0.7	0.4	0.7
Semiconductors	1.6	3.1	6.0	6.7	2.6	2.3	1.2	0.6	0.9	3.4
Optics	1.5	1.8	6.4	3.4	1.7	1.7	1.5	1.0	0.8	3.9
Measurement	6.1	3.9	4.3	3.4	5.7	5.2	5.2	8.0	7.4	5.1
Analysis of biological materials	0.4	0.9	0.3	0.4	0.6	0.9	1.4	1.4	2.1	0.7
Control	2.5	1.9	1.8	1.4	1.8	1.3	1.9	1.4	1.6	1.1
Medical technology	2.2	8.3	3.4	3.1	4.8	4.2	6.4	7.1	6.3	10.8
Organic fine chemistry	2.1	3.0	1.6	1.4	3.5	4.9	4.6	7.8	1.6	3.7
Biotechnology	1.7	3.6	0.9	1.4	1.7	2.8	4.1	5.9	1.8	3.6
Pharmaceuticals	4.5	5.6	1.2	1.9	2.5	4.2	6.6	11.5	4.2	3.5
Macromolecular chemistry, polymers	2.1	1.4	2.1	1.2	2.1	1.6	0.8	2.0	0.8	3.4
Food chemistry	4.7	1.1	0.8	1.7	0.5	0.8	1.3	3.5	15.3	3.2
Basic materials chemistry	4.4	3.0	2.1	1.6	3.4	2.1	3.3	3.2	2.9	4.9
Materials, metallurgy	3.9	1.1	2.4	2.0	2.0	2.3	1.5	1.6	4.8	0.9
Surface technology, coating	1.7	1.4	2.4	1.5	1.7	1.6	1.1	1.5	1.8	1.2
Micro-structural and nanotechnology	0.2	0.2	0.1	0.2	0.2	0.2	0.2	0.1	0.8	0.1
Chemical engineering	3.1	2.0	1.4	2.0	2.7	2.5	3.0	2.4	3.3	2.7
Environmental technology	2.5	1.0	1.3	1.6	1.5	1.5	1.9	1.2	2.1	1.8
Handling	3.1	2.0	2.9	2.0	3.3	2.3	2.6	5.8	0.9	2.9
Machine tools	4.7	1.5	2.4	2.0	3.7	1.6	1.2	1.7	2.8	1.0
Engines, pumps, turbines	1.5	2.7	3.2	1.9	6.3	4.9	3.6	2.9	4.6	1.0
Textile and paper machines	1.7	0.9	2.5	0.9	1.5	0.7	0.8	2.3	0.4	1.3
Other special machines	4.5	2.6	2.8	2.7	3.6	3.6	2.5	2.6	5.4	4.7
Thermal processes and apparatus	2.1	0.8	1.8	1.9	1.7	1.7	1.3	1.3	1.5	1.0
Mechanical elements	2.4	2.0	3.1	2.0	7.2	3.9	3.2	2.0	3.3	1.6
Transport	2.6	3.2	5.6	5.2	9.8	10.1	5.0	1.7	4.2	2.4
Furniture, games	2.1	2.3	4.1	2.5	1.6	1.6	3.3	2.8	1.0	2.4
Other consumer goods	2.1	1.7	1.5	2.7	1.9	2.3	3.9	4.2	1.2	1.8
Civil engineering	4.0	3.2	2.3	3.9	3.3	3.2	5.0	2.0	6.3	4.1

Note: Data refer to published patent applications. There is a minimum delay of 18 months between the application date and the publication date. WIPO's IPC technology concordance table was used to convert IPC symbols into 35 corresponding fields of technology. For an electronic version of the IPC technology concordance table, visit www.wipo.int/ipstats. The top 10 origins were selected based on their 2014–2016 total published applications.

Sources: WIPO Statistics Database and EPO PATSTAT database, September 2018.

A33. Trend in patent applications in energy-related technologies, 2002–2016

Note: For definitions of the technologies – fuel cells, geothermal, solar and wind energy – see annex A. The correspondence between IPC symbols and technology fields is not always clear (there is no one-to-one correspondence). It is therefore difficult to capture all patents in a specific technology field. Even so, the IPC-based definitions are likely to capture the vast majority of patent applications in these areas. Data refer to published patent applications.

Sources: WIPO Statistics Database and EPO PATSTAT database, September 2018.

A34. Relative specialization for patent applications in energy-related technologies for the top origins, 2014–2016

Note: For definitions of the technologies – fuel cells, geothermal, solar and wind energy – see annex A. The correspondence between IPC symbols and technology fields is not always clear (there is no one-to-one correspondence). It is therefore difficult to capture all patents in a specific technology field. Even so, the IPC-based definitions are likely to capture the vast majority of patent applications in these areas. Data refer to published patent applications.

Women’s participation in PCT international patenting

A35. PCT applications with women inventors, 2003–2017

Note: In order to attribute gender to inventors’ names recorded in PCT applications, WIPO produced a world gender–name dictionary based on information from 13 different public sources. Gender is attributed to a given name on a country-by-country basis because certain names can be considered male in one country but female in another.

Source: WIPO Statistics Database, September 2018.

A36. Share of PCT applications with women inventors for the top 20 origins, 2017

Note: In order to attribute gender to inventors’ names recorded in PCT applications, WIPO produced a gender–name dictionary based on information from 13 different public sources. Gender is attributed to a given name on a country-by-country basis because certain names can be considered male in one country but female in another.

Source: WIPO Statistics Database, September 2018.

A37. Distribution of inventors listed in PCT applications for the top 20 origins, 2017

Note: In order to attribute gender to inventors' names recorded in PCT applications, WIPO produced a gender-name dictionary based on information from 13 different public sources. Gender is attributed to a given name on a country-by-country basis because certain names can be considered male in one country but female in another.

Source: WIPO Statistics Database, September 2018.

A38. Share of PCT patent applications with women inventors by field of technology, 2017

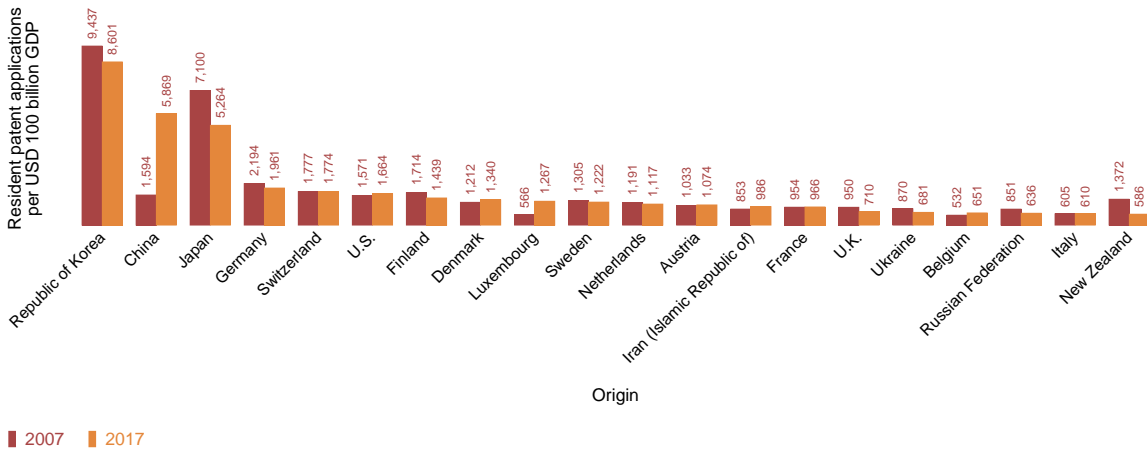

Note: In order to attribute gender to inventors' names recorded in PCT applications, WIPO produced a gender-name dictionary based on information from 13 different public sources. Gender is attributed to a given name on a country-by-country basis because certain names can be considered male in one country but female in another.

Source: WIPO Statistics Database, September 2018.

Patent applications in relation to GDP and population

A39. Resident patent applications per USD 100 billion GDP for the top 20 origins, 2007 and 2017

Note: GDP data are in 2011 US PPP dollars. The top 20 origins were included if they had a GDP greater than USD 25 billion PPP and more than 100 resident patent applications. Due to space constraints, only the top 20 origins that fulfil these criteria are presented.
Sources: WIPO Statistics Database and World Bank, September 2018.

A40. Resident patent applications per million population for the top 20 origins, 2007 and 2017

Note: The top 20 origins were included if they had a population greater than 5 million and if they had more than 100 resident patent applications. Due to space constraints, only the top 20 origins that fulfil these criteria are presented.
Sources: WIPO Statistics Database and World Bank, September 2018.

Patents in force

A41. Trend in patents in force worldwide, 2008–2017

Note: World totals are WIPO estimates using data covering 122 offices.
Source: WIPO Statistics Database, September 2018.

A42. Patents in force at the top 20 offices, 2017

.. indicates not available.

Source: WIPO Statistics Database, September 2018.

A43. Patents in force in 2017 as a percentage of total applications

Note: Percentages are calculated as the number of patent applications filed in year *t* and in force in 2017, divided by the total number of patent applications filed in year *t*. Patent holders must pay maintenance fees to maintain the validity of their patents. Depending on technological and commercial considerations, patent holders may opt to let a patent lapse before the end of the full protection term. This figure shows the distribution of patents in force in 2017 as a percentage of total applications in the year of filing. However, not all offices provide these data. Data for 65 offices show that 40–43% of the applications for which patents were eventually granted remained in force for at least 6 to 10 years after the application date. About 21% of these patents lasted the full 20-year patent term.

Source: WIPO Statistics Database, September 2018.

A44. Average age of patents in force at selected offices, 2012 and 2017

Source: WIPO Statistics Database, September 2018.

Patent office procedural data

A45. Distribution of patent examination outcomes for selected offices, 2017

Note: The share of applications granted should not be interpreted as grant rates, as they are based on the examination date rather than the date when the application was filed. The number of grants in a given year relates to applications filed in previous years. WIPO collects data from IP offices using a common questionnaire and methodology. However, due to differences in patent procedures between offices, data cannot be fully harmonized. Therefore, one should exercise caution when making comparisons across offices.
Source: WIPO Statistics Database, September 2018.

A46. Potentially pending applications at the top 20 offices, 2017

.. indicates not available.
Note: EPO is the European Patent Office. Application processing varies between offices, making it difficult to measure pending applications. In some offices, patent applications automatically proceed to the examination stage unless applicants withdraw them; in others, applications do not proceed to examination unless applicants file a separate request for examination. To take account of procedural differences, pending application data are separated between (a) all patent applications, at any stage in the process, that are awaiting a final decision by a patent office, including those for which applicants have not filed a request for examination (where applicable) and (b) patent applications undergoing examination for which the applicant has requested examination (where such separate requests are necessary). Data for Brazil include both pending patent and utility model applications, and so are not comparable with other offices.
Source: WIPO Statistics Database, September 2018.

A47. Average pendency times for first office action and final decision at selected offices, 2017

Note: EPO is the European Patent Office. WIPO collects data from IP offices using a common questionnaire and methodology. However, due to differences in patent procedures between offices, data cannot be fully harmonized. Therefore, one should exercise caution when making comparisons across offices.

Source: WIPO Statistics Database, September 2018.

A48. Average years of experience of patent examiners for selected offices, 2017

Source: WIPO Statistics Database, September 2018.

Patent applications filed through the Patent Cooperation Treaty (PCT) System

A49. Trend in PCT applications, 2002–2017

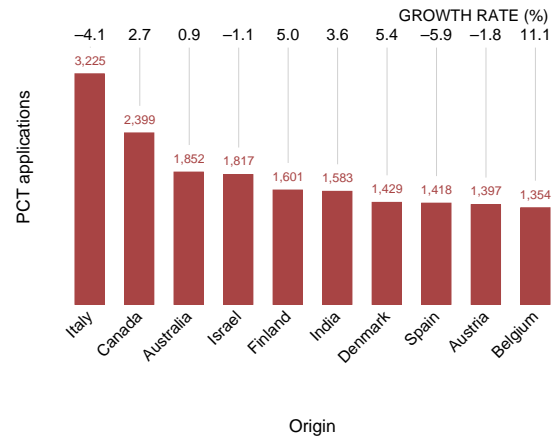

Note: Data refer to the international phase of the Patent Cooperation Treaty System. Counts are based on the international application date.
Source: WIPO Statistics Database, September 2018.

A50. PCT applications by origin, 2017

Note: Data refer to the international phase of the Patent Cooperation Treaty System. Counts are based on the residency of the first named applicant and the international application date.
Source: WIPO Statistics Database, September 2018.

A51. PCT applications for the top 20 origins, 2017

Note: Data refer to the international phase of the Patent Cooperation Treaty System. Counts are based on the residency of the first named applicant and the international application date.

Utility model applications

A54. Trend in utility model applications worldwide, 2003–2017

Note: China's 2017 data are not comparable with its previous years' data due to the new way in which the IP office of China now counts its applications data. Prior to 2017, it included all applications received; however, starting in 2017, China's application count data include only those applications for which the office has received the necessary application fees (see the data description section). Due to this break in the data series and to the large number of filings in China, it is not possible to report an accurate 2017 growth rate at world level. World totals are WIPO estimates using data covering 75 patent offices. These totals include applications filed directly with national and regional offices and applications entering offices through the Patent Cooperation Treaty national phase (where applicable).
Source: WIPO Statistics Database, September 2018.

A55. Utility model applications for the top 20 offices, 2017

.. indicates not available.

Note: * China's 2017 data are not comparable with its previous years' data due to the new way in which the IP office of China counts its applications data. Prior to 2017, the IP office of China included all applications received; however, starting in 2017, China's application count data include only those applications for which the office has received the necessary application fees (see the data description section). Due to this break in the data series, it is not possible to report an accurate growth rate for China.

Note: FTE is full time equivalent. Grant data differ slightly from grant data reported elsewhere in this report due to different dates of extraction. Every effort has been made to compile procedural data based on common definitions and concepts, but procedural differences make it extremely difficult to fully harmonize such data. For instance, "rejection" is not recorded as a final decision in Canada. Applicants are informed of the action that they must take or questions that they must answer in order for their application to be considered, and if an applicant cannot provide the required information, they are regarded as having abandoned the application. A similar situation exists in Australia.

Trademarks

Highlights

Applications grew by an extraordinary 30% in 2017

An estimated 9.11 million trademark applications were filed worldwide in 2017, 30% more than in 2016 (see figure 2.1). This marks the eighth consecutive year of growth and the highest level of growth recorded in recent decades. There are currently almost three times as many trademark applications being filed around the world than in 2007 – applications have increased every year except for two during this 11-year period, and five years saw annual growth exceed 10%.

After slowing in 2007 and showing slight declines in 2008 and 2009, trademark applications rebounded in 2010 and have continued to increase year on year. In 2010, the large number of applications filed in China accounted for 53% of the increase in overall growth. Since then, China's share has climbed to 90%. About 60% of all applications in 2017 were filed in China alone.

An estimated 9.11 million trademark applications were filed worldwide

2.1. Trademark applications worldwide, 2007–2017

Source: Figure B1.

When differences in filing systems across national and regional offices are harmonized using the application class count, trademark filing activity in 2017 also saw a double-digit increase, up 26.8% on the previous year. The total number of classes specified in applications – known as the application class count – reached an estimated 12.39 million (see figure 2.2). Excluding the 2017 application class count for China, trademark filing activity grew by a more moderate 9.5% in the rest of the world.

The total number of classes specified in trademark applications grew by 26.8%

Source: Figure B2.

Class count

A trademark application may refer to different classes of goods or services. Many offices use the Nice Classification, an international classification of goods and services for registering trademarks and service marks. Applications received by these offices are classified in one or more of the 45 Nice classes (see www.wipo.int/classifications/nice). Some offices allow single-class filing only, meaning that applicants have to file a separate application for each class. Others permit multi-class filings, enabling applicants to file a single application in which a number of classes can be specified. To improve international comparisons of the numbers of applications received, it helps to compare class counts across offices. Class counts are also used to make trademark registration activity internationally comparable. This method for comparing offices began in 2004, the first year for which complete class count data are available.

Offices with the most filing activity

As with other forms of intellectual property (IP), the increase in trademark filing activity (measured in application class counts) largely reflects the strong growth in the number of trademark applications filed in China. In 2017, the trademark office of China accounted for 78% of the annual increase in global trademark filing activity using this measure. It was followed by the offices of the Islamic Republic of Iran (6%) and Japan (4%), which accounted for considerably smaller portions of total growth.

The office of China's class count of over 5.7 million was followed by a count of 613,921 at the office of the United States of America (U.S.) (see figure 2.3). These have been the top two offices since the early 2000s

Non-resident applicants accounted for 30.2% of total trademark filing activity in the U.S.

2.3. Trademark application class counts for the top 10 offices, 2017

Source: Figure B10.

but, since 2007, China's class count has grown from close to twice that of the U.S. to over nine times as much. These two offices were followed by that of Japan (560,269), the European Union Intellectual Property Office (EUIPO) (371,508) and that of the Islamic Republic of Iran (358,353). The top five offices in 2017 accounted for 62% of all trademark filing activity, up from the 33% shared by the top five offices a decade earlier, in 2007.

Among the top 20 offices, 16 had higher levels of trademark filing activity in 2017 than in 2016, of which eight recorded growth exceeding 10%. The largest increases were in the Islamic Republic of Iran (+87.9%) and China (+55.2), followed by Japan (+24.2%), the United Kingdom (U.K.) (+24.1%) and Canada (+19.5%). In contrast, the office of India (-9.5%) saw the largest annual drop, while the offices of France (-1.4%), Italy (-1%) and the Republic of Korea (-0.6%) recorded small declines (see figure B11).

For offices located in low- and middle-income countries, annual growth was particularly high in Namibia (+47.1%), Gambia (+21.6%) and Georgia (+14.1%) (see figure B13). The office of South Africa, however, witnessed a large decrease of 30.9% in trademark filing activity from 2016 to 2017.

At most offices, trademark applications are filed mainly by residents seeking protection within their domestic jurisdiction. In 2017, residents accounted for 83.1% of global filing activity. In fact, domestic filing is becoming increasingly pronounced as a share of total filing activity, with the world resident application class count having increased by 32% on the previous year's total; in contrast, the application class count for non-residents increased by only 6%.

Due largely to the high number of resident trademark applications in China, the global non-resident share of filing activity declined by about 16 percentage points, from a peak of 33.1% in 2004 to 16.9% in 2017. However, when the figures for China are excluded, the non-resident share fell by only around 8 percentage points over the same period.

Of the top 20 offices, half had non-resident filing shares of 20% or greater, with Australia (41.9%), Canada (43.5%), Switzerland (55.6%), the U.S. (30.2%) and Viet Nam (34.7%) recording the highest shares. The lowest non-resident shares were recorded at the offices of China (3.5%), France (6.5%) and the Islamic Republic of Iran (8.2%) (see figure B10). The low non-resident shares for France and other European Union (EU) member state offices can be explained by the fact that many non-resident applicants file for protection in these countries via the EUIPO.

Resident filing activity overwhelmingly drove the double-digit growth in Brazil, Canada, China, the Islamic Republic of Iran, Japan and the Russian Federation, whereas non-resident filing activity accounted for most or all of the total growth in Australia, the EUIPO and Viet Nam (see figure B11). For the U.K. and the U.S., the annual increases in filing activity by residents and non-residents were more balanced. In France, India, Italy and the Republic of Korea, declines in total filing activity can be attributed entirely or mainly to a drop in resident applications.

The list of top 20 offices in 2017 is largely similar to the 2016 list, but ranked somewhat differently. For example, the Islamic Republic of Iran was the largest mover, shifting up six places to become the fifth largest

The share for offices of high-income countries declined from 56.3% in 2007 to 31.6% in 2017

2.4. Trademark application class counts by income group, 2007 and 2017

Source: Table B7.

Offices located in Asia accounted for 66.6% of all trademark filing activity in 2017

2.5. Trademark application class counts by region, 2007 and 2017

Source: Table B8.

office in terms of trademark filing activity. In addition, the Russian Federation and Switzerland moved up one spot each, to rank sixth and 17th, respectively. In contrast, France, India and the Republic of Korea each moved down two places from their previous year's rankings.

Total application class counts at offices of high-income economies grew only slightly (+2.3%) between 2007 and 2017. This is lower than the average annual growth rates for all other income groups. The highest growth (+15.2%) over this 11-year period was recorded for offices of upper middle-income countries. Offices of lower middle-income (+5%) and low-income (+3.1%) countries also saw growth over the same period.

Twelve of the top 20 offices are in high-income economies, six are in upper middle-income countries (Brazil, China, the Islamic Republic of Iran, Mexico, the Russian

Federation and Turkey) and two are in lower middle-income countries (India and Viet Nam). In 2017, the offices of high-income countries together received 31.6% of total global filing activity, down from 56.3% in 2007. In contrast, the share for offices of upper middle-income countries rose from 32.8% in 2007 to 60.5% in 2017, due to their combined high average annual growth (see figure 2.4). When China's statistics are removed from the upper middle-income group, the application class count for the other countries in this group still grew between 2007 and 2017, but at a lower rate of 4.6%. However, the combined share of the world total claimed by this group of upper middle-income countries actually decreased from 20.1% to 14.2%. The shares of total filing activity for lower middle-income (7.1% in 2017) and low-income countries (0.7% in 2017) also fell over the same period, although to a lesser extent.

Trademark filings since 1883

Trademark filings were fairly low and stable until the mid-1980s. Filings at China's office took off in the 1990s, and in 2001 they exceeded those received by that of the U.S., making China's office the largest in terms of the number of applications received. Even so, filings in the U.S. have doubled since the mid-1990s, despite declines at the end of the dot-com era in 2001 and 2002 and again during the financial crisis in 2008 and 2009. Having remained below 100,000 until 2006, India's trademark annual filings now exceed 260,000. Similar numbers of trademark applications are now filed in both Brazil and Japan, where the volumes are approaching 190,000.

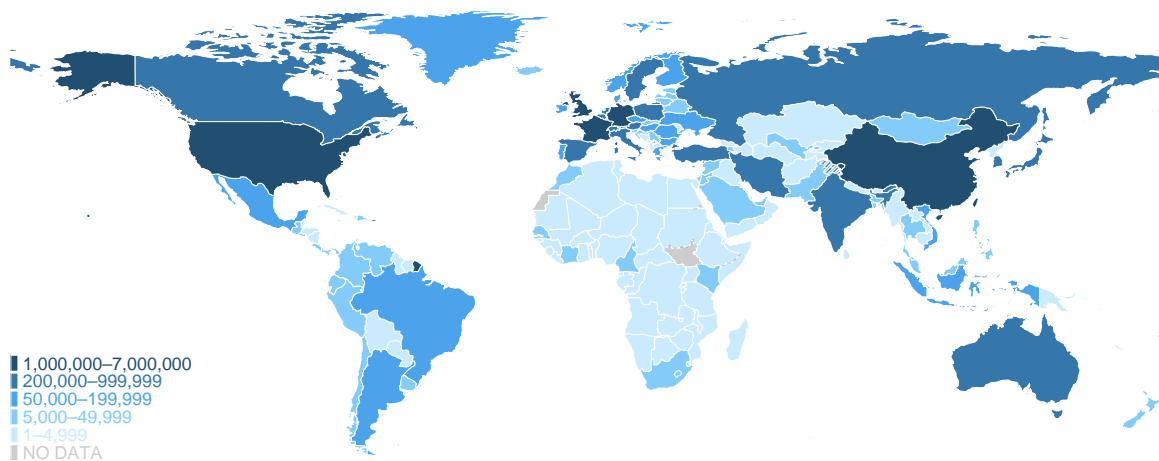

Trend in trademark applications for the top five offices, 1883–2017

Source: Figure B9.

Trademark filing activity was concentrated in a few origins

2.6. Equivalent trademark application class counts by origin, 2017

Source: Map B19.

Eight of the top 20 offices in 2017 were located in Europe, seven in Asia, two each in Latin America and the Caribbean (LAC) and North America, and one in Oceania. Offices in Asia accounted for 66.6% of all trademark filing activity, up from 36.1% in 2007. This partly explains the decline in overall shares for the other five geographical regions over the same period (see figure 2.5). Offices in Europe accounted for 17.7% of the world total in 2017, followed by North America (6.4%), LAC (5.8%), Africa (1.9%) and Oceania (1.5%).

Equivalent application class count

Applications at some regional IP offices are equivalent to multiple applications in the countries that are members of the organizations establishing those offices. For example, to calculate the number of equivalent applications for the EUIPO, each application is multiplied by the corresponding number of EU member states. So an application filed with the EUIPO by an applicant residing outside the EU is counted as 28 applications abroad – equivalent to the 28 member countries of the EU in 2016. An application filed by an applicant residing in an EU country is counted as one resident application and 27 applications abroad. The same multiplier is applied to the classes specified in these applications. The equivalent application class count concept is used for reporting data by origin.

German applicants continue to file the greatest number of applications abroad

Trademark applications received by offices from resident and non-resident applicants are referred to as office data, whereas applications filed by applicants at a national/regional office (resident applications) or at foreign offices (applications abroad) are referred to as origin data. Here, trademark statistics based on the origin of the residence of the applicant are reported in order to complement the picture of trademark filing activity worldwide.

In terms of filing activity abroad based on equivalent class count, a greater number of applicants from Germany than from any other origin seek protection for their trademarks outside their country, a position Germany has held since 2006. In 2017, German filing activity abroad reached an equivalent application class count of 2.11 million, followed by applicants from the U.S. (1.22 million), the U.K. (982,367) and France (868,198) (see figure B22).¹ The high equivalent class counts for applications abroad from these origins can be explained, not only by their high application class counts at numerous offices abroad, but also by their frequent use of the EUIPO – with its multiplier effect – to seek protection within the EU as a whole.

Looking at absolute counts, and so removing the EUIPO's multiplier effect, 96% of all filing activity (application class counts) by China-based applicants was in China alone, with only 4% attributed to those seeking protection abroad. The shares for resident filing and filing abroad were similar for applicants

Applicants from the U.S. were the most active foreign filers in China, Mexico and at the EUIPO.

2.7. Share of total non-resident filing activity by origin at selected offices, 2017

Source: Figure B25.

from Argentina, Brazil and India. Applicants residing in many other low- and middle-income countries also dedicated less than 10% of their trademark filing activity to seeking protection abroad.

Among the top 20 origins, about 72% of filing activity by Switzerland-based applicants occurred outside the country. This highest ranking share of applications abroad as a proportion of total filing activity was followed by that of applicants from the U.S. (44%), the Netherlands (43%) and Germany (42%).

Applicants from the upper middle-income countries Armenia (32%), Bulgaria (27%) and Mauritius (63%) sought protection abroad for more than one-quarter of their trademark filing activity. For the upper middle-income countries Colombia, Kyrgyzstan, the Russian Federation, South Africa and Thailand, the share was 12–17%.

When deciding where to seek trademark protection, applicants consider such factors as the appeal of various foreign markets in which to sell their goods and services, geographical proximity to these markets or well-established historical ties between the trademark holder's country of residence and the destination country. For example, 38% of all non-resident filing activity in Mexico in 2017 came from U.S. applicants, 9% from Germany and 6% from China (see figure 2.7). Applicants from China (30%) and the U.K. (9%) accounted for the largest shares of non-resident trademark filing activity in the U.S., followed by applicants from Canada (8%). In China, the three origins accounting for the largest shares of non-resident filing activity were the U.S. (21%), Japan (10%) and Germany (9%). For non-resident filing activity

at the EUIPO, applicants from the U.S. (32%), China (21%) and Switzerland (12%) constituted the largest shares.

For the second year in a row, applicants from China remained the most active foreign filers at the German IP office, accounting for 22% of application class counts in filings that the office received from abroad.

Adjusting for GDP and population

Differences in trademark filing activity across countries may reflect both the size of their economies and their level of economic development. To compare trademark filing intensity across countries, it helps to measure resident application class counts relative to GDP or population level.

When resident trademark applications are viewed as class counts and adjusted by GDP, countries with a lower number of classes specified in resident applications, such as Chile, New Zealand and Switzerland, may rank higher than some countries that otherwise show higher class counts (for example, India and the U.S.). Of selected origins, China (26,098), New Zealand (9,884), the Republic of Korea (9,798), Switzerland (8,643) and Chile (7,717) exhibited among the highest ratios of resident application class count to GDP in 2017 (see figure 2.8). China (+19,797), the U.K. (+2,020) and Brazil (+2,081) saw particularly large increases in resident application class count per unit of GDP between 2007 and 2017. In contrast, New Zealand (-1,740), Chile (-1,697) and the Republic of Korea (-1,016) saw decreases in their class count to GDP ratio over the same period.

Brazil, China and the U.K. saw large increases in resident application class count per unit of GDP between 2007 and 2017

2.8. Resident trademark application class count per USD 100 billion GDP for selected origins, 2007 and 2017

Source: Figure B33.

The data reflecting application class count per million population present a somewhat different picture. Switzerland, with a population of about 8.5 million, reported a resident application class count of 4,962 per million – one of the most intensive among all countries of origin in 2017. Among other selected origins, the resident application class count per million population exceeded 3,000 for Australia (3,262), China (3,995), Germany (3,310) and the Republic of Korea (3,521). Argentina, the Russian Federation and the U.S. each had ratios of about 1,300–1,600, while the ratios for Ecuador, Serbia and Thailand were all between 400 and 500 (see figure B34).

Which classes and industries saw the most filing activity?

Trademarks are registered in relation to particular classes of goods or services. The Nice Classification of goods and services is used in the international trademark system and at certain national and regional offices. Nice Classification statistics offer insights into the relative importance of different goods and services. Service class 35 (advertising, business management, business administration and office functions) has been number one since 2004 – when complete class counts first became available – and, in 2017, was represented in 11% of all reported trademark filing activity by class. Nice class 35 is followed by goods class 25 (7%), which includes articles of clothing; goods class 9 (6.6%), which includes scientific, photographic, measuring instruments, recording equipment, computers and software; and service class 41 (5.5%), which relates to education, entertainment and sports activities (see figure B26).

The 11 service-related classes accounted for about 37% of all Nice classes specified in applications filed in 2017, up from 30% in 2004. Services classes accounted for between 31% and 35% of all filing activity in Canada, China, India and the Russian Federation, and over 50% in the offices of Brazil, France, Japan and Spain.

It is useful to group the 45 Nice classes into 10 industry sectors. Agriculture, research and technology, business services and clothing were the top four sectors in 2017, each accounting for between 13% and 18% of global reported trademark filing activity. In contrast, industries relating to chemicals (2.4%) and transportation (5.4%) accounted for the smallest shares (see figure B28). The distribution of total trademark applications across industries has remained stable for more than a decade.

Concordant with being the global top industry in terms of trademark filing activity, agriculture was the top sector at the offices of China (22%), the Islamic Republic of Iran (22%), the Republic of Korea (19%) and the Russian Federation (16%) (see figure B29). Agriculture was the second top sector in India and Turkey, accounting for between 15 and 17% of all trademark filing activity in these countries in 2017. Research and technology was the top industry sector at the EUIPO (21%) and the offices of France (20%), Japan (27%) and the U.S. (20%), but ranked third in Turkey (11%), the Republic of Korea (13%) and the Russian Federation (12%). In Turkey, business services topped the list of industry sectors, accounting for 21% of all trademark filing activity. Among the top 10, only the offices of India (20%) and the Republic of Korea (17%) listed health among their top three industry sectors for trademark filing, and only the office of the Islamic Republic of Iran (19%) included the transportation sector among its top three.

A total of 5.45 million trademark registrations were recorded worldwide in 2017

After concluding the examination process, an office may decide to register a trademark. The number of registrations issued can fluctuate greatly from year to year, due in part to the resources dedicated by offices to examining trademark applications. For this reason, it is not possible to accurately compare the number of applications filed at an office in a given year with the number of registrations issued by that office in the same year.

The estimated 5.45 million trademark registrations recorded worldwide in 2017 represent an increase of 18.2%, or 836,500 additional registrations, on the previous year's total.

Just as class counts make application activity internationally comparable, they also permit a more meaningful comparison of registrations. In 2017, an estimated 7.62 million classes were specified in trademark registrations. After the modest growth of 2.7% recorded in 2016, 2017 saw a return to double-digit growth of 16.3%. China's office saw growth of 24.1% in trademark registration activity in 2017, accounting for 51% of the total global annual increase.

China's office registered trademarks in which about 2.82 million classes were specified, followed by the offices of the U.S. (361,759), India (339,692) and the EUIPO (335,435) (see figure B17).

Along with the high annual growth in China, several other offices among the top 20 experienced large increases in registration activity, including Brazil (+23.4%), India (+68.2%), Italy (+102.2%) and the U.K. (+32.2%). In contrast, the offices of Canada (-18.6%) and Turkey (-5.4%) saw the most significant declines among the top 20.

Active trademarks increased by 9.7%

Unlike most forms of IP, trademarks can be maintained indefinitely by payment of renewal fees at defined time intervals. In 2017, there were an estimated 43.2 million active trademark registrations at 138 offices worldwide, representing an increase of 9.7% on 2016 figures.

Once again, the office of China accounted for the greatest number of trademark registrations in force in 2017, with about 14.92 million – a 20.6% increase on its 2016 total. It was followed by the offices of the U.S. (2.19 million), Japan (1.87 million) and India (1.61 million). With between 1 million and 1.25 million trademark registrations in force each, the EUIPO and the offices of Brazil, Mexico and the Republic of Korea also recorded high numbers of active trademarks. Germany (940,991) had almost the same number of trademark registrations in force as Turkey (945,154), while Argentina (830,640) and France (840,000) also had similar figures (see figure B38).

About 15.2 million trademark registrations in force at 66 offices in 2017 can be distributed according to the year in which they were initially registered. This represents 57% of the total of approximately 26.5 million trademark registrations recorded at these offices between 1991 and 2017.

About one-fifth of these trademarks registered in 1991 remained in force in 2017, reflecting the enduring value of marks. For those registered in 2007 and later, the percentage rises above 50%. Almost half of these 15.2 million registrations in force have a recent registration date, dating back only to 2012.

Demand for Madrid international trademark registrations continues to grow

To obtain trademark protection in multiple countries or jurisdictions, applicants can either file their applications directly at each individual office – known as the “Paris route” – or file an application for international registration through the Madrid System – the “Madrid route” (see the glossary). In 2017, the Madrid System

offered trademark holders the ability to obtain protection for their branded products and services in an area covering a total of 116 countries.

Madrid international applications² totaled 57,139 in 2017, up 6.7% on 2016, marking the eighth consecutive year of growth. In fact, since 2004 the number of applications has increased in all but one year, which coincided with the economic downturn in 2009. This prevailing growth is due partly to the expanding membership of the Madrid System and partly to a general upward trend in trademark application volumes worldwide.

For the fourth year in a row, the U.S. remained the largest user of the Madrid System. International applications filed by applicants located in the U.S. reached 7,889 (see figure B49). These were followed by applications from Germany (7,319), China (6,066) and France (4,260). Applicants domiciled in China filed about 2,200 more Madrid applications in 2017 than in 2016, which translated to a high growth rate of 57.8% and allowed China to surpass France to become the third largest origin of Madrid applications.

The EU (22,914) attracted the highest number of designations in international Madrid applications in 2017, edging slightly ahead of China (22,565), which was last year’s top destination for international trademark registrations. The U.S. (21,990) ranked third. Madrid applicants sought to extend protection for their marks to the 28 EU member countries as a whole more than to any other Madrid member jurisdiction. Middle-income countries, including the Russian Federation (15,322), India (12,124) and Mexico (9,388) were also among the top 10 destinations for international trademark registration via the Madrid System. For further information and statistics, see the *Madrid Yearly Review 2018*.

1. Equivalent application class counts differ from absolute class counts, which are presented in figure B20 and do not take into account the multiplying effect of regional offices.
2. Due to continual updating of statistics, figures for Madrid applications and designations published in this report have been revised from their values presented in the *Madrid Yearly Review 2018*.

Trademark applications and registrations by office

B7. Trademark application class counts by income group, 2007 and 2017

Income group	Application class count		Resident share (%)		Share of world total (%)		Average growth (%)
	2007	2017	2007	2017	2007	2017	2007–2017
High-income	3,126,400	3,916,400	68.7	71.1	56.3	31.6	2.3
Upper middle-income	1,822,400	7,499,800	70.7	91.3	32.8	60.5	15.2
<i>Upper middle-income without China</i>	<i>1,117,500</i>	<i>1,760,000</i>	<i>61.2</i>	<i>74.4</i>	<i>20.1</i>	<i>14.2</i>	<i>4.6</i>
Lower middle-income	539,800	879,100	59.6	66.2	9.7	7.1	5.0
Low-income	67,900	92,300	40.1	44.2	1.2	0.7	3.1
World	5,556,500	12,387,600	68.1	83.1	100.0	100.0	8.3

Note: Totals by income group are WIPO estimates using data covering 164 IP offices. Each category includes the following number of offices: high-income (62), upper middle-income (46), lower middle-income (35) and low-income (21). Data for the European Union Intellectual Property Office are allocated to the high-income group because most EU member states are high-income countries. For similar reasons, data for the African Regional Intellectual Property Organization and the African Intellectual Property Organization are allocated to the low-income group. For information on income group classification, see the data description section.

B8. Trademark application class counts by region, 2007 and 2017

Region	Application class count		Resident share (%)		Share of world total (%)		Average growth (%)
	2007	2017	2007	2017	2007	2017	2007–2017
Africa	185,000	240,300	41.9	48.2	3.3	1.9	2.6
Asia	2,005,300	8,252,600	72.6	89.5	36.1	66.6	15.2
Europe	2,158,900	2,194,600	66.9	74.4	38.9	17.7	0.2
Latin America and the Caribbean	518,200	715,900	62.9	69.0	9.3	5.8	3.3
North America	543,400	797,700	73.1	66.7	9.8	6.4	3.9
Oceania	145,700	186,500	57.2	52.3	2.6	1.5	2.5
World	5,556,500	12,387,600	68.1	83.1	100.0	100.0	8.3

Note: Totals by geographical region are WIPO estimates using data covering 164 IP offices. Each region includes the following number of offices: Africa (34), Asia (45), Europe (42), Latin America and the Caribbean (36), North America (2) and Oceania (5).

Source: WIPO Statistics Database, September 2018.

B9. Trend in trademark applications for the top five offices, 1883–2017

Note: Data are based on the numbers of applications filed; that is, differences between single-class and multi-class filing systems across IP offices are not taken into account. The top five offices were selected based on their 2017 totals.

Source: WIPO Statistics Database, September 2018.

B10. Trademark application class counts for the top 20 offices, 2017

Note: EUIPO is the European Union Intellectual Property Office.
Source: WIPO Statistics Database, September 2018.

B11. Contribution of resident and non-resident application class counts to total growth for the top 20 offices, 2016–2017

Note: EUIPO is the European Union Intellectual Property Office. This figure shows, for each office, the total growth or decrease in application class counts, broken down by the respective contributions of resident and non-resident filing activity. For example, the total number of classes specified in trademark applications in the U.S. grew by 12.6%. Growth in resident filing activity accounted for 7.3 percentage points of this increase, whereas the remaining 5.3 percentage points came from non-resident filing activity.
Source: WIPO Statistics Database, September 2018.

B12. Trademark application class counts for offices of selected low- and middle-income countries, 2017

Note: The selected offices are from different world regions and income groups (low-income, lower middle-income and upper middle-income). OAPI is the African Intellectual Property Organization, which receives applications on behalf of its 17 member states. Where available, data for all offices are presented in statistical table B51 at the end of this section.
 Source: WIPO Statistics Database, September 2018.

B13. Contribution of resident and non-resident application class counts to total growth for offices of selected low- and middle-income countries, 2016–2017

Note: The selected offices are from different world regions and income groups (low-income, lower middle-income and upper middle-income). OAPI is the African Intellectual Property Organization, which receives applications on behalf of its 17 member states. Where available, data for all offices are presented in statistical table B51 at the end of this section. This figure shows, for each office, the total growth or decrease in application class counts, broken down by the respective contributions of resident and non-resident applications. For example, the total number of classes specified in trademark applications at the IP office of Ukraine grew by 3.6%. Growth in resident filing activity accounted for 2.4 percentage points of this increase, whereas the remaining 1.2 percentage points came from non-resident filing activity.
 Source: WIPO Statistics Database, September 2018.

B14. Trademark registration class counts by income group, 2007 and 2017

Income group	Registration class count		Resident share (%)		Share of world total (%)		Average growth (%)
	2007	2017	2007	2017	2007	2017	2007–2017
High-income	2,394,500	2,782,300	60.9	64.1	59.4	36.5	1.5
Upper middle-income	1,155,400	4,019,900	57.4	84.4	28.7	52.8	13.3
<i>Upper middle-income without China</i>	<i>877,500</i>	<i>1,202,400</i>	<i>51.1</i>	<i>61.3</i>	<i>21.8</i>	<i>15.8</i>	<i>3.2</i>
Lower middle-income	423,800	740,700	46.0	60.7	10.5	9.7	5.7
Low-income	55,600	76,000	22.1	22.1	1.4	1.0	3.2
World	4,029,300	7,618,900	57.8	74.1	100.0	100.0	6.6

Note: Totals by income group are WIPO estimates using data covering 163 IP offices. Each category includes the following number of offices: high-income (62), upper middle-income (46), lower middle-income (34) and low-income (21). Data for the European Union Intellectual Property Office are allocated to the high-income group because most EU member states are high-income countries. For similar reasons, data for the African Regional Intellectual Property Organization and the African Intellectual Property Organization are allocated to the low-income group. For information on income group classification, see the data description section.

B15. Trademark registration class counts by region, 2007 and 2017

Region	Registration class count		Resident share (%)		Share of world total (%)		Average growth (%)
	2007	2017	2007	2017	2007	2017	2007–2017
Africa	136,100	194,100	29.5	29.9	3.4	2.5	3.6
Asia	1,232,900	4,486,000	58.0	82.5	30.6	58.9	13.8
Europe	1,789,400	1,789,300	58.1	68.1	44.4	23.5	0.0
Latin America and the Caribbean	460,000	546,000	62.2	58.8	11.4	7.2	1.7
North America	319,500	439,700	63.0	61.3	7.9	5.8	3.2
Oceania	91,400	163,800	51.0	45.2	2.3	2.1	6.0
World	4,029,300	7,618,900	57.8	74.1	100.0	100.0	6.6

Note: Totals by geographical region are WIPO estimates based on data covering 163 offices. Each region includes the following number of offices: Africa (33), Asia (45), Europe (42), Latin America and the Caribbean (36), North America (2) and Oceania (5).

Source: WIPO Statistics Database, September 2018.

B16. Trend in trademark registrations for the top five offices, 1883–2017

Note: EUIPO is the European Union Intellectual Property Office. Data are based on the numbers of registrations recorded; that is, differences between single-class and multi-class registration systems across IP offices are not taken into account. The top five offices were selected based on their 2017 totals.

Source: WIPO Statistics Database, September 2018.

B17. Trademark registration class counts for the top 20 offices, 2017

Note: EUIPO is the European Union Intellectual Property Office and BOIP is the Benelux Office for Intellectual Property. Figures for the office of France are not presented here because the data are not available. On the basis of an examination, a registration may be issued for a trademark application. The number of registrations issued may fluctuate greatly from one year to the next, in part reflecting the resources that IP offices dedicate to examining trademark applications.

Source: WIPO Statistics Database, September 2018.

B18. Trademark registration class counts for offices of selected low- and middle-income countries, 2017

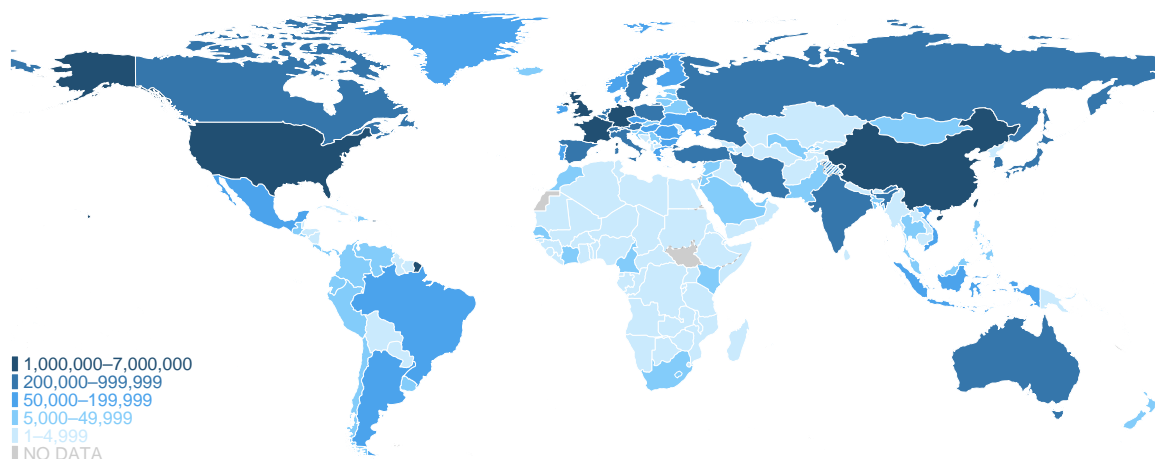

Note: The selected offices are from different world regions and income groups (low-income, lower middle-income and upper middle-income). Where available, data for all offices are presented in statistical table B52 at the end of this section.

Source: WIPO Statistics Database, September 2018.

Trademark applications by origin

B19. Equivalent trademark application class counts by origin, 2017

Note: Trademark filing activity by origin includes the number of classes specified in resident applications and in applications filed abroad. The origin of a trademark application is determined by the residence of the applicant. Applications filed at regional offices are considered equivalent to multiple applications in the relevant member states and the classes specified in these applications are multiplied accordingly. See the glossary for the definition of equivalent application.

Source: WIPO Statistics Database, September 2018.

B20. Trademark application class counts for the top 20 origins, 2017

Note: In this figure, trademark application filing activity by origin includes the number of classes specified in resident applications and in applications filed abroad and is based on absolute count, not equivalent count. The origin of a trademark application is determined by the residence of the applicant. An application filed at a regional office is considered a resident filing if the applicant is a resident of one of the relevant member states.

Source: WIPO Statistics Database, September 2018.

B21. Trademark application class counts for selected low- and middle-income origins, 2017

Note: In this figure, trademark application filing activity by origin includes the number of classes specified in resident applications and in applications filed abroad and is based on absolute count, not equivalent count. The origin of a trademark application is determined by the residence of the applicant. The selected origins are from different world regions and income groups (low-income, lower middle-income and upper middle-income). Where available, data for all origins are presented in statistical table B51 at the end of this section.

Source: WIPO Statistics Database, September 2018.

B22. Trademark application class counts abroad for the top 20 origins, 2017

Note: This figure distinguishes between absolute counts and equivalent counts for filing activity abroad – that is, resident applications are excluded. Based on equivalent application class counts, applicants from Germany had the highest level of trademark filing activity abroad. This was due not only to their high application class counts at numerous foreign offices, but also to their frequent use of the European Union Intellectual Property Office (EUIPO) – with its multiplier effect – to seek trademark protection within the entire EU. See the glossary for the definition of equivalent application. The origin of a trademark application is determined by the residence of the applicant.

Trademark applications by Nice class and industry sector

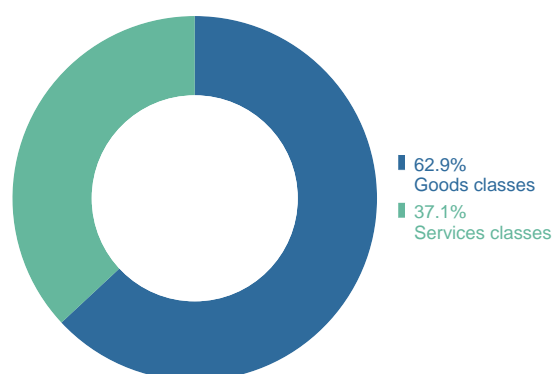

B26. Distribution of trademark applications by top Nice classes, 2017

Rank	Class	Class share (%)
1	35 Advertising, business management, business administration and office functions	11.0
2	25 Clothing, footwear, headgear	7.0
3	9 Scientific, photographic, measuring instruments; recording equipment; computers and software	6.6
4	41 Education, entertainment, and sporting activities	5.5
5	30 Coffee, tea, cocoa, rice, flour, bread, pastry and confectionery, sugar, honey, yeast, salt, mustard, vinegar, sauces (condiments) and spices	4.8
6	42 Scientific and technological services, design and development of computer hardware and software	4.3
7	5 Pharmaceutical preparations, baby food, dietary supplements for humans and animals, disinfectants, fungicides and herbicides	4.0
8	43 Services for providing food and drink; temporary accommodation	3.9
9	3 Bleaching preparations and other substances for laundry use; cleaning and abrasive preparations; soaps, perfumery and cosmetics	3.5
10	29 Foodstuffs of animal origin and vegetables	3.4
	Remaining classes	46.0

Note: These figures are based on filing data from 131 IP offices. Some classes listed are abbreviated. See www.wipo.int/classifications/nice for a complete list of all classes.

Source: WIPO Statistics Database, September 2018.

B27. Trademark applications by goods and services classes, 2017

Note: In the 45-class Nice Classification, the first 34 classes indicate goods and the remaining 11 refer to services. See www.wipo.int/classifications/nice for a complete list of all classes. These figures are based on filing data from 131 IP offices.

Source: WIPO Statistics Database, September 2018.

B28. Trademark applications by industry sector, 2017

Note: Industry sectors based on class groups are those defined by Edital. Some industry sectors are abbreviated. See annex B for full definitions and composition of Nice goods and services classes. These figures are based on filing data from 131 IP offices.

Source: WIPO Statistics Database, September 2018.

B29. Trademark applications by top three sectors at the top offices, 2017

Note: EUIPO is the European Union Intellectual Property Office. Industry sectors based on class groups are those defined by Edital. Some industry sectors are abbreviated. See www.wipo.int/classifications/nice for a complete list of all classes. The top three sectors and top offices were selected based on their 2017 totals.

Trademark registrations in force

B37. Trend in trademark registrations in force worldwide, 2010–2017

■ TRADEMARK REGISTRATIONS IN FORCE ■ GROWTH RATE (%)

Note: World totals are WIPO estimates using data covering 138 IP offices. Data refer to the number of trademark registrations in force, not the number of classes specified in those registrations. Trademark rights can be maintained indefinitely by paying renewal fees at defined time intervals. Trademarks in force provide information on the volume of trademark registrations currently active as well as the historical trademark life cycle. Source: WIPO Statistics Database, September 2018.

B38. Trademark registrations in force for the top 20 offices, 2017

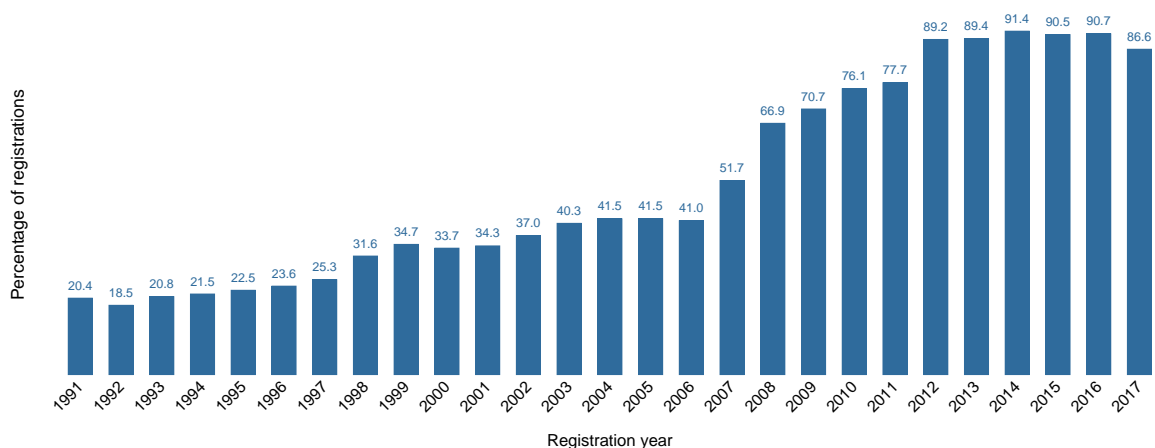

.. indicates unavailable.

Note: EUIPO is the European Union Intellectual Property Office and BOIP is the Benelux Office for Intellectual Property. Data refer to the number of trademark registrations in force, not the number of classes specified in those registrations.

Source: WIPO Statistics Database, September 2018.

B39. Trademark registrations in force in 2017 as a percentage of total registrations recorded between 1991 and 2017

Note: Percentages are calculated as follows: the number of trademark registrations issued in year t and in force in 2017 divided by the total number of trademark registrations issued in year t . Trademark holders must pay renewal fees to maintain the validity of their marks, which in most cases can be maintained indefinitely. This figure is based on about 15.2 million active trademark registrations reported by 66 offices that provided a breakdown by year of registration. Detailed data for several larger offices, such as those of China, France, Italy and Japan, are not available.

Source: WIPO Statistics Database, September 2018.

(a) Data on application class count by origin are incomplete because some offices do not report detailed statistics containing the origin of application class counts.

(b) Only Madrid designation data are available, so application class count by office and origin data may be incomplete.

(c) This country does not have a national trademark office. All applications for trademark protection are filed at the Benelux Office for Intellectual Property or the European Union Intellectual Property Office.

(d) Resident applications include those filed by residents of Belgium, Luxembourg and the Netherlands.

(e) Resident applications include those filed by residents of EU member states.

(f) Origin is defined as the country/territory of the stated residence of the applicant in an international application.

(g) Total includes an aggregate direct application class count that cannot be broken down into direct and non-resident components.

(h) The African Intellectual Property Office (OAPI) is the competent office for processing applications.

n.a. indicates not applicable.

.. indicates not available.

(a) Data on registration class count by origin are incomplete because some offices do not report detailed statistics containing the origin of registration class counts.

(b) Only Madrid designation data are available, so registration class count by office and origin data may be incomplete.

(c) This country does not have a national trademark office. All trademark registrations for this country are issued by the Benelux Office for Intellectual Property or the European Union Intellectual Property Office.

(d) Resident registrations include those issued to residents of Belgium, Luxembourg and the Netherlands.

(e) Resident registrations include those issued to residents of EU member states.

(f) Origin is defined as the country/territory of the stated residence of the holder of an international registration.

(g) Total includes an aggregate direct registration class count that cannot be broken down into direct and non-resident components.

(h) The African Intellectual Property Office (OAPI) is the competent office for issuing registrations.

n.a. indicates not applicable.

.. indicates not available.

Industrial designs

Highlights

Designs contained in applications totaled 1.24 million in the world

An estimated 945,100 applications were filed worldwide in 2017 (see figure 3.1). The number of designs contained in these applications (design count) totaled 1.24 million (see figure 3.2). Unfortunately, it is not possible to calculate a meaningful growth rate for global design applications in 2017. The intellectual property (IP) office of China changed its methodology in 2017 and now counts only those industrial design application filings for which the filing fees have been paid. As filings in China account for more than half of all industrial design applications filed around the world, comparison of 2016 and 2017 estimated world totals would not reflect the actual trend in global filing activity.

An estimated 945,100 industrial design applications were filed worldwide

Source: Figure C2.

Designs contained in applications filed at the U.K. IP office almost doubled

The office of China received applications containing 50.6% of all designs in applications filed worldwide in 2017, representing 628,658 designs. The office of China was followed by the European Union Intellectual Property Office (EUIPO) (111,021), the offices of the Republic of Korea (67,357), of Turkey (46,875) and of the United States of America (U.S.) (45,881) (see figure 3.3).

The top 20 offices combined accounted for 92.3% of designs in all applications. The 2017 annual growth rate for the office of China is not available due to its change in methodology, mentioned earlier. Of the 19 remaining offices, 13 saw increases in their application design count, among which six experienced double-digit growth (see figure C11). The offices of the United Kingdom (U.K.) (+92.1%), Spain (+23.5%) and Switzerland (+17.9%) saw the sharpest increases. The EUIPO (+6.2%) and the office of Japan (+4.7%) also had higher design counts in 2017 than in the previous year. In contrast, the offices of Germany (-18.5%), France (-17.8%) and Morocco (-12.5%) all saw significant decreases.

Among offices located in low- and middle-income countries, annual growth in 2017 was particularly high for Georgia (+82.1%), Ghana (+69.2%), Mongolia (+52%) and Malaysia (+27.1%). The offices of Bangladesh, Egypt, the African Intellectual Property Organization (OAPI) and the Republic of Moldova saw double-digit growth of between 12% and 18% (see figure C13).

Designs contained in resident applications accounted for 83.7% of the world total design count in 2017. The proportion was boosted by the high resident design share in China (97.2%). Resident design counts accounted for the majority of filing activity in all of the top 20 offices except for Canada (12.5%), Switzerland (32.9%) and Australia (37%).

An increase in the number of designs contained in resident applications had a positive impact on the overall annual growth rates for 10 of the top 20 offices, and for seven of them, it was the primary driver of growth, with particularly high contributions to total growth in both Spain and the U.K. The increases in resident design counts explain the overall growth seen at the offices of Brazil, India, the Islamic Republic of Iran and the Russian Federation (see figure C11). An increase in the non-resident design count was the main or sole driver of growth at nine offices, which included the offices of Canada, the EUIPO, Switzerland and the U.S.

Design count

Some offices allow industrial design applications to contain more than one design for the same good or in the same class; others allow only one design per application. To capture the differences in application filing systems across offices, one needs to compare their respective application and registration design counts.

Equivalent design count

Designs in applications filed at regional offices are equivalent to multiple designs in applications filed in the respective member states of those offices. To calculate the number of equivalent designs for the African Intellectual Property Organization (OAPI) which has 17 member states, the Benelux Office for Intellectual

Property (BOIP) which has three, and the EUIPO (28), each design is multiplied by the corresponding number of member states. However, the African Regional Intellectual Property Organization (ARIPO) does not register industrial designs with automatic region-wide applicability. Therefore, for this office, each application is counted as one application abroad if the applicant does not reside in a member state or as one resident application and one application abroad if the applicant resides in a member state.

The offices of all upper middle-income countries combined received 59.1% of all designs contained in applications filed in 2017 (see table C7). China accounted for the vast majority of this share, with the other upper middle-income countries receiving only 8.5% of the world total. The combined share of the high-income countries stood at 36.8%. Offices of lower middle-income countries received 3.9% of the total, and those of low-income countries only 0.3%.

Between 2007 and 2017, average annual growth in design counts was 8% for upper middle-income countries.¹ Over the same period, offices in high-income (+1.6%), lower middle-income (+1.8%) and low-income (+1.3%) economies had much lower growth rates in comparison.

Asia accounted for more than two-thirds (67.9%) of all designs in applications filed worldwide in 2017 (see figure 3.4). It was followed by Europe (24.4%) and North America (4.2%). All geographical regions experienced positive average annual growth between 2007 and 2017, with Asia (+6.9%) and North America (+4.8%) experiencing the largest increases.

China received 50.6% of all designs contained in applications filed worldwide

Industrial design applications filed since 1883

Between 1883 and the early 1950s, the offices of Japan and the U.S. averaged similar numbers of applications, rarely exceeding 10,000. The office of Japan received the largest number of applications per year from the 1950s to the late 1990s, reaching approximately 50,000 annual filings at its peak. The office of China began receiving applications in 1985 and saw unprecedented growth: from 640 in 1985 to 660,000 in 2013. The office of the Republic of Korea surpassed the office of Japan in 2004 and has remained in second position since then. In 2012, the office of the U.S. moved ahead of the office of Japan to become the third largest. Ranked fifth is the EUIPO, which began receiving applications in 2003. Unlike the other four offices, the EUIPO has a multiple design system. Applications filed at the EUIPO contained 111,021 designs in 2017.

Trend in industrial design applications for the top five offices, 1883–2017

Source: Table C9.

Equivalent design counts from applicants in Japan increased by 16.2%

Applications received by offices from resident and non-resident applicants are referred to as office data, whereas applications filed by applicants at their home office (resident applications) or at foreign offices (applications abroad) are referred to as origin data. Here, industrial design statistics based on the origin of residence of the first named applicant are reported in order to complement the picture of industrial design activity worldwide. As with the office data, the 2017 annual growth rate for applicants residing in China is not available due to the change in how the office of China counts the applications it receives.

Applicants from China had the highest equivalent design count in 2017, numbering almost 858,000 (see map 3.5). They were followed by applicants residing in Germany (676,139), the U.S. (353,707) and Italy (304,664). Equivalent designs in applications filed abroad accounted for between 79% and 98% of the total for applicants from all of the top 20 origins, except for those from China (28.8%), Turkey (30.7%) and the Republic of Korea (48.9%).

Among the top 10 origins, the largest increases in equivalent design counts were experienced in Japan (+16.2%), Switzerland (+11.3%) and in the U.S. (+10.4%). In contrast, applicants from Italy (-16.5%), Spain (-12.4%) and the Republic of Korea (-11.5%) saw the sharpest decreases in equivalent design count compared to 2016 (see figure C17).

European countries dominate the top 20 origins with a total of 13, followed by five origins located in Asia and one each in Oceania and North America. In terms of income categories, 18 of the top 20 origins belong to the high-income group, while two upper middle-income countries – China and Turkey – also feature.

Applicants from Germany (615,045), the U.S. (330,139) and Italy (266,177) had the highest number of equivalent designs in applications filed abroad in 2017. Among the top 10 origins of equivalent designs in applications filed abroad, applicants from China (+54.9%), Japan (+20.5%), the U.S. (+11.5%) and Switzerland (+11.3%) saw the most pronounced increases.

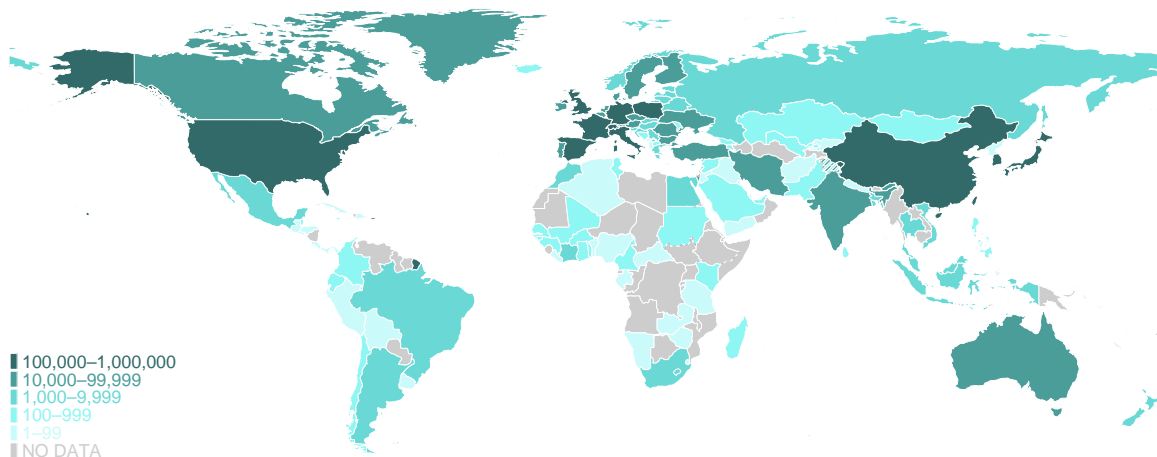

The Republic of Korea tops the ranking when adjusting for GDP and population

The Republic of Korea (3,265) had the highest resident design count per 100 billion US dollars (USD) of gross domestic product (GDP) in 2017 (see figure 3.6). It was followed by China (2,878) and Turkey (1,938). Germany, Italy and Spain each had ratios between 1,500 and 2,000. Among other European countries, Switzerland (887), France (689) and the Russian Federation (104) had much lower ratios.

The Republic of Korea (1,174) was also the country with by far the highest resident design count per million population in 2017 (see figure C26). It was followed by Germany (739) and Italy (636). Compared to the 2007 ratios, those for 2017 sharply increased for China (441) and Spain (543). Even though residents of Japan

Applicants from China had the highest equivalent design count

3.5. Equivalent design counts by origin, 2017

Source: Map C16.

The Republic of Korea had the highest number of designs per unit of GDP both in 2007 and 2017

3.6. Resident application design count per USD 100 billion GDP for the top 10 origins, 2007 and 2017

Source: Figure C25.

and the U.S. ranked among the top five in terms of industrial design application filings, their 2017 ratios of resident design count per million population were relatively low, with ratios of 193 and 72, respectively.

Furnishing and clothing remained the most recorded classes

The Locarno classification includes 32 classes of industrial designs. In 2017, the classes that accounted for the largest shares of the world total remained furnishings (10%), clothing (8.5%) and packages and containers (7.2%). These three classes combined accounted for one-quarter of all designs in applications (see figure C22).

Grouping the Locarno classes into 12 industry sectors highlights the most important sectors for designs contained in industrial design applications filed in each country. For all of the top 10 offices for which data were available, at least one-third of their total design count was concentrated in just three sectors, although these top three sectors varied from office to office (see figure 3.7). For example, advertising, furniture and household goods and textiles and accessories accounted for 71.4% of total design count at the office of France and 64.8% at the office of Germany. Leisure and education, packaging and transport were the top three sectors at the office of the Russian Federation and represented 35.4% of total design count.

In half of the top 10 countries of origin, the majority of designs in applications were filed among their top three sectors, with applicants residing in Switzerland (70.1%) and Italy (67.7%) recording the highest level of concentration among their top three sectors (see figure C24). The textiles and accessories sector was among the top three sectors for nine of the top 10 origins, whereas furniture and household goods featured in the top three sectors for six of them.

Industrial design registrations worldwide rose to 711,400

An estimated 711,400 industrial designs were registered worldwide in 2017. This represents an annual increase of 0.8%, following a drop of 3.5% in 2016 (see figure C4). This growth was mainly due to a considerable increase in the number of registrations issued by the U.K. office, which registered 17,195 applications in 2017, more than doubling the number of registrations it recorded the previous year.

An estimated 985,900 designs were contained in applications registered in 2017, up 1.5% on 2016. The office of China accounted for nearly 45% of all designs in applications registered worldwide, and the top 20 offices combined comprised 91% of the total. Among these offices, 12 saw annual growth, including the U.K. (+102.7%), India (+39%), Spain (+27.6%) and Switzerland (+19%). In contrast, the offices of the Republic of Korea (-11.6%), Brazil (-10.8%) and Canada (-9.1%) all saw sharp decreases in the number of designs registered (see figure C14).

Designs related to textiles and accessories accounted for a fifth of total design in India and the Republic of Korea

3.7. Distribution of application design counts by the top three sectors and for the top 10 offices, 2017

Source: Figure C23.

Around 1.46 million industrial design registrations were in force in China

A record 3.75 million industrial design registrations were in force worldwide in 2017, up 5% on 2016 (see figure C27). The number of registrations in force in China increased by 105,504 to reach 1.46 million, representing 38.9% of the world total. China was followed by the Republic of Korea (339,350), the U.S. (321,314), Japan (254,060) and the EUIPO (210,605). The top five offices saw growth of between 0.3% (Republic of Korea) and 8.1% (EUIPO).

German applicants remained the largest users of the Hague System

The Hague System offers applicants an advantageous way to seek industrial design protection internationally as an alternative to using the Paris Convention for the Protection of Industrial Property. For further information and statistics on the System, see the *Hague Yearly Review 2018*.

In 2017, the Hague System received 5,213 international applications, down 6.3% on 2016. These applications contained 19,429 designs, representing an annual growth of 3.8% (see figure C31). It was the 11th consecutive year of growth in application design counts.

Applicants residing in Germany remained the largest users of the Hague System, with 4,261 designs in applications. They were followed by those residing in Switzerland (2,935), the Republic of Korea (1,742), the U.S. (1,661) and France (1,396). These five origins

combined accounted for 61.7% of the total. While the U.S. (+17.8%), France (+15.2%), Switzerland (+14.9%) and Germany (+8.8%) all experienced sharp increases in design count, the Republic of Korea (–7.4%) saw its first drop since joining the System in 2014.

The European Union (EU) was the most designated Hague member with 15,124 designs in designations in 2017. It was followed by Switzerland (9,604), Turkey (6,615), the U.S. (4,534) and Norway (3,546). Of these top five designated Hague members, all saw annual growth ranging from 1.2% for the EU to 9% for Switzerland, except for the U.S., which saw its design count decrease by 4% compared to 2016.

1 The recent methodological change of the office of China affects this growth rate but, given the long-term nature of the comparisons, the resulting bias is relatively small.

Industrial design applications and registrations worldwide

C1. Trend in industrial design applications worldwide, 2004–2017

■ APPLICATIONS ■ GROWTH RATE (%)

Note: China's 2017 data are not comparable with its previous year's data due to the new way in which the IP office of China counts its applications data. Prior to 2017, it included all applications received; however, starting in 2017, China's application count data include only those applications for which the office has received the necessary application fees. As China accounts for the bulk of the global total, it is not possible to report the 2017 worldwide application growth rate. World totals are WIPO estimates using data covering 151 IP offices. These totals include the numbers of applications filed directly with national and regional offices (known as the "Paris route") as well as the numbers of designations received via the Hague System (where applicable).

These totals include design counts in registrations issued by national and regional offices for applications filed directly with offices (known as the “Paris route”) as well as for designations received via the Hague System (where applicable). See the glossary for the definition of design count.

Source: WIPO Statistics Database, September 2018.

C6. Resident and non-resident registration design counts worldwide, 2004–2017

■ RESIDENT ■ NON-RESIDENT

Note: World totals are WIPO estimates using data covering 147 IP offices. These totals include design counts in registrations issued by national and regional offices for applications filed directly with offices (known as the “Paris route”) as well as for designations received via the Hague System (where applicable). See the glossary for the definition of design count.

Source: WIPO Statistics Database, September 2018.

Industrial design applications and registrations by office

C7. Application design counts by income group, 2007 and 2017

Income group	Number of designs in applications		Resident share (%)		Share of world total (%)		Average growth (%)
	2007	2017	2007	2017	2007	2017	2007–2017
High-income	390,800	456,500	71.1	70.8	50.4	36.8	1.6
Upper middle-income	341,200	734,100	88.6	93.4	44.0	59.1	8.0
<i>Upper middle-income without China</i>	<i>73,800</i>	<i>105,400</i>	<i>66.2</i>	<i>71.3</i>	<i>9.5</i>	<i>8.5</i>	<i>3.6</i>
Lower middle-income	40,400	48,100	48.4	61.5	5.2	3.9	1.8
Low-income	3,000	3,400	33.4	29.9	0.4	0.3	1.3
World	775,400	1,242,100	77.5	83.7	100.0	100.0	4.8

Note: Average growth rate is provided for 2007–2017, as the change in the method of reporting application data at the IP office of China has limited impact on long-term average growth rates. Totals by income group are WIPO estimates using data covering 151 IP offices. Each category includes the following number of offices: high-income countries/economies (57), upper middle-income (43), lower middle-income (37) and low-income (14). Data for the European Union Intellectual Property Office are allocated to the high-income group because most EU member states are high-income countries. For similar reasons, data for the African Regional Intellectual Property Organization and the African Intellectual Property Organization are allocated to the low-income group. For information on income group classification, see the data description section.

Source: WIPO Statistics Database, September 2018.

C8. Application design counts by region, 2007 and 2017

Region	Number of designs in applications		Resident share (%)		Share of world total (%)		Average growth (%)
	2007	2017	2007	2017	2007	2017	2007–2017
Africa	18,400	18,900	47.4	55.7	2.4	1.5	0.3
Asia	432,900	843,700	89.6	92.1	55.8	67.9	6.9
Europe	268,800	302,600	66.5	71.7	34.7	24.4	1.2
Latin America and the Caribbean	14,600	15,500	41.3	47.9	1.9	1.2	0.6
North America	32,800	52,400	48.9	46.5	4.2	4.2	4.8
Oceania	7,900	9,000	42.2	35.6	1.0	0.7	1.3
Total	775,400	1,242,100	77.5	83.7	100.0	100.0	4.8

Note: Average growth rate is provided for 2007–2017, as the change in the method of reporting application data at the IP office of China has limited impact on long-term average growth rates. Totals by geographical region are WIPO estimates using data covering 151 IP offices. Each region includes the following number of offices: Africa (29), Asia (41), Europe (46), Latin America and the Caribbean (28), North America (2) and Oceania (5). For information on geographical region classification, see the data description section.

C9. Trend in industrial design applications for the top five offices, 1883–2017

Note: The decrease in applications at the IP office of China in 2017 is mostly explained by the new way in which the office counts its applications data. Prior to 2017, it included all applications received; however, starting in 2017, China's application count data include only those applications for which the office has received the necessary application fees. EUIPO is the European Union Intellectual Property Office. Data are based on the numbers of applications filed; that is, differences between single-design and multiple-design filing systems across IP offices are not taken into account. The top five offices were selected based on their 2017 totals.
Source: WIPO Statistics Database, September 2018.

C10. Application design counts for the top 20 offices, 2017

Note: EUIPO is the European Union Intellectual Property Office.
Source: WIPO Statistics Database, September 2018.

C11. Contribution of resident and non-resident application design counts to total growth for the top 20 offices, 2016–2017

.. indicates not available.

Note: * China's 2017 data are not comparable with its previous year's data due to the new way in which the IP office of China counts its applications data. Prior to 2017, it included all applications received; however, starting in 2017, China's application count data include only those applications for which the office has received the necessary application fees. For this reason, it is not possible to report China's 2017 growth rate. EUIPO is the European Union Intellectual Property Office. This figure shows total growth in application design counts, broken down by the respective contributions of resident and non-resident filings. For example, total design counts in Italy grew by 14.2%, with resident applicants contributing 8.1 percentage points to this overall growth.

Source: WIPO Statistics Database, September 2018.

C12. Application design counts for offices of selected low- and middle-income countries, 2017

Note: ARIPO is the African Regional Intellectual Property Organization. OAPI is the African Intellectual Property Organization. The selected offices are from different world regions and income groups (low-income, lower middle-income and upper middle-income). Where available, data for all offices are presented in the statistical table at the end of this section.

Source: WIPO Statistics Database, September 2018.

C13. Contribution of resident and non-resident application design counts to total growth for offices of selected low- and middle-income countries, 2016–2017

.. indicates not available.

Note: ARIPO is the African Regional Intellectual Property Organization. OAPI is the African Intellectual Property Organization. The selected offices are from different world regions and income groups (low-income, lower middle-income and upper middle-income). Where available, data for all offices are in the statistical table at the end of this section. This figure shows total growth in design counts, broken down by the respective contributions of resident and non-resident filings. For example, the total design count in Ghana grew by 69.2%, with resident applicants contributing 49.6 percentage points to this overall growth.

Source: WIPO Statistics Database, September 2018.

C14. Registration design counts for the top 20 offices, 2017

Note: EUIPO is the European Union Intellectual Property Office. Registration design count data for France are not available.

Source: WIPO Statistics Database, September 2018.

C15. Registration design counts for offices of selected low- and middle-income countries, 2017

.. indicates not available.

Note: OAPI is the African Intellectual Property Organization. The selected offices are from different world regions and income groups (low-income, lower middle-income and upper middle-income). Where available, data for all offices are presented in the statistical table at the end of this section.

Source: WIPO Statistics Database, September 2018.

Application design counts by origin

C16. Equivalent application design counts by origin, 2017

Note: Equivalent application design count includes resident applications and applications filed abroad. The origin of an industrial design application is determined by the residence of the first named applicant. Applications filed at some regional offices are considered equivalent to multiple applications in the member states of those offices. See the glossary for the full definition of equivalent application and design count.

Source: WIPO Statistics Database, September 2018.

C17. Equivalent application design counts for the top 20 origins, 2017

.. indicates not available.

Note: * China's 2017 data are not comparable with its previous year's data due to the new way in which the IP office of China counts its applications data. Prior to 2017, it included all applications received; however, starting in 2017, China's application count data include only those applications for which the office has received the necessary application fees. For this reason, it is not possible to report China's 2017 growth rate (see the data description section for further details). The origin of an industrial design application is determined by the residence of the first named applicant. An application filed at a regional office is considered to be a resident filing if the applicant is a resident of one of that office's member states. See the glossary for the definition of equivalent application and design count.

Source: WIPO Statistics Database, September 2018.

C18. Application design counts for the top 20 origins, 2017

.. indicates not available.

Note: China's 2017 data are not comparable with its previous year's data due to the new way in which the IP office of China counts its applications data. Prior to 2017, it included all applications received; however, starting in 2017, China's application count data include only those applications for which the office has received the necessary application fees. For this reason, it is not possible to report China's 2017 growth rate (see the data description section for further details). Data are based on absolute count, not equivalent count. The origin of an industrial design application is determined by the residence of the first named applicant. An application filed at a regional office is considered to be a resident filing if the applicant is a resident of one of that office's member states.

Source: WIPO Statistics Database, September 2018.

C19. Application design counts for selected low- and middle-income origins, 2017

.. indicates not available.

Note: Data are based on absolute count, not equivalent count. The selected origins are from different world regions and income groups (low-income, lower middle-income and upper middle-income). Where available, data for all origins are presented in the statistical table at the end of this section. The origin of an industrial design application is determined by the residence of the first named applicant.

Source: WIPO Statistics Database, September 2018.

C20. Flows of non-resident design counts for the top five origins and the top 10 offices of high-income economies, 2017

Industrial designs

Note: EUIPO is the European Union Intellectual Property Office. Data are based on absolute count, not equivalent count.
 Source: WIPO Statistics Database, September 2018.

C21. Flows of non-resident design counts for the top five origins and the top 10 offices of low- and middle-income economies, 2017

Note: Data are based on absolute count, not equivalent count.
 Source: WIPO Statistics Database, September 2018.

Application design counts by Locarno class and industry sector

C22. Application design counts by Locarno class, 2017

Note: See annex C for class numbers. These figures are based on data from 107 IP offices. Data for several large offices are not available or are incomplete, including the offices of China, Japan and the U.S.

Source: WIPO Statistics Database, September 2018.

C23. Distribution of application design counts by the top three sectors and for the top 10 offices, 2017

Note: EUIPO is the European Union Intellectual Property Office. A concordance table produced by the Organisation for Economic Co-operation and Development (OECD) was used to convert the 32 classes into 12 industry sectors (see annex C for definitions). The top three sectors and top 10 offices were selected based on their 2017 totals. Data for several large offices are not available or are incomplete, including the offices of China, Japan and the U.S.

Source: WIPO Statistics Database, September 2018.

C24. Distribution of application design counts by the top three sectors for the top 10 origins, 2017

Note: A concordance table produced by the Organisation for Economic Co-operation and Development (OECD) was used to convert the 32 classes into 12 industry sectors (see annex C for definitions). These figures are based on data from 107 IP offices. Data for several large offices are not available or are incomplete, including the offices of China, Japan and the U.S.

Source: WIPO Statistics Database, September 2018.

Application design count in relation to GDP and population

C25. Resident application design count per USD 100 billion of GDP for the top 20 origins, 2007 and 2017

Note: GDP data are in constant 2011 US PPP dollars. Origins were selected based on the top 20 origins list in terms of application design count. Sources: WIPO Statistics Database and World Bank, September 2018.

C26. Resident application design count per million population for the top 20 origins, 2007 and 2017

Note: Origins were selected based on the top 20 origins list in terms of application design count. Sources: WIPO Statistics Database and World Bank, September 2018.

Industrial design registrations in force

C27. Trend in industrial design registrations in force worldwide, 2010–2017

■ REGISTRATIONS IN FORCE ■ GROWTH RATE (%)

Note: WIPO estimates cover 113 IP offices and include direct national and regional applications as well as designations received via the Hague System. Data refer to the number of industrial design registrations in force and not the number of designs contained in registrations in force.

Source: WIPO Statistics Database, September 2018.

C28. Industrial design registrations in force for the top 20 offices, 2017

.. indicates not available.

Note: EUIPO is the European Union Intellectual Property Office. Data refer to the number of industrial design registrations in force and not the number of designs contained in registrations in force. Registrations in force data are not available for France and Italy.

Source: WIPO Statistics Database, September 2018.

C29. Industrial design registrations in force in 2017 as a percentage of total registrations

Note: Percentages are calculated using the number of industrial designs registered in year *t* and in force in 2017 divided by the total number of industrial designs registered in year *t*. The graph is based on data from 77 offices (including most large offices, with the exception of France, Italy and Japan) for which a breakdown of industrial design registrations in force by year of registration was available.

Source: WIPO Statistics Database, September 2018.

C30. Average age of industrial design registrations in force at selected offices, 2012 and 2017

Note: EUIPO is the European Union Intellectual Property Office.

Source: WIPO Statistics Database, September 2018.

Industrial design applications through the Hague System

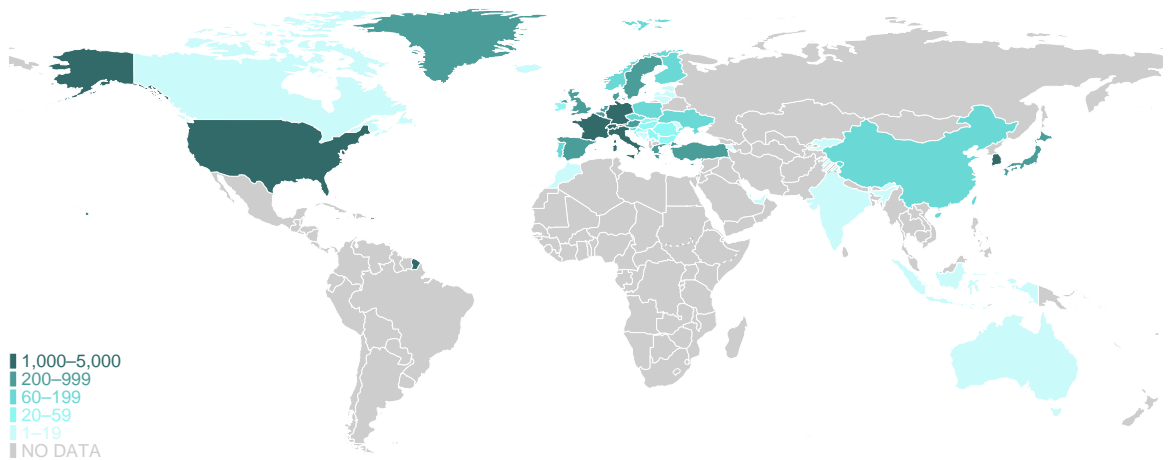

C31. Trend in designs contained in Hague international applications, 2004–2017

■ DESIGNS IN APPLICATIONS ■ GROWTH RATE (%)

Source: WIPO Statistics Database, September 2018.

C32. Designs contained in Hague international applications by origin, 2017

Note: Applicants residing in a non-member country can file applications for international registrations if they have a real and effective industrial or commercial establishment within the jurisdiction of a Hague member.

Source: WIPO Statistics Database, September 2018.

C33. Designs contained in Hague international applications for the top 20 origins, 2017

Note: Applicants residing in a non-member country can file applications for international registrations if they have a real and effective industrial or commercial establishment within the jurisdiction of a Hague member. The top 20 origins were selected based on the number of designs contained in applications filed in 2017.

Source: WIPO Statistics Database, September 2018.

C34. Designs contained in designations in Hague international applications for the top 20 designated Hague members, 2017

Source: WIPO Statistics Database, September 2018.

(a) Design count by origin data are incomplete because some offices do not report the origin of applications.

(b) Only Hague designation data are available and/or the office has not reported the origin of applications, so design count by office and origin data may be incomplete.

(c) Origin is defined as the country of the stated address of residence of the first named applicant in an international application.

(d) The African Intellectual Property Organization (OAPI) is the competent office for processing applications.

Plant varieties

Highlights

Plant variety applications grew at their fastest rate in 15 years

Around 18,490 plant variety applications were filed worldwide in 2017, up 11.7% on 2016 – the largest increase in applications in 15 years (see figure 4.1). The offices of China, the United Kingdom (U.K.), the Community Plant Variety Office of the European Union (CPVO), Viet Nam and Ukraine accounted for most of this growth.

China becomes the top filing office

China became the top filing office in 2017, receiving 4,465 applications. The CPVO received 3,422 applications. This marks the first time in over 23 years that the CPVO was not the top destination for plant variety filings. The CPVO was followed by the national offices of the United States of America (U.S.) (1,557), Ukraine (1,345) and Japan (1,019) (see figure 4.2). Filings in China represent a 52.8% year-on-year growth, driven almost entirely by resident filings. Among the other offices in the top five, the CPVO (+3.7%), Japan (+4.3%) and Ukraine (+5.6%) experienced growth, while the U.S. (-2.9%) was the only top-five office to experience a decline in filings. The growth at the CPVO and in the Ukraine office was driven by resident filings, whereas an increase in non-resident filings drove growth in Japan. The decline in filings in the U.S. was the result of a decrease in non-resident filings, which outweighed the slight year-on-year increase in resident filings.

The combined share of applications received at the top five offices worldwide increased, from around 61% in 2016 to 64% in 2017, due to the large growth experienced by China. This concentration was only partially offset by the U.S. decline.

Eight of the top 10 offices received more applications from residents than from non-residents. Among these offices, China's resident share (89.7%) was the highest. In contrast, Australia and Ukraine received more than half their filings from non-resident applicants.

Offices of high-income economies accounted for the largest proportion (52.2%) of plant variety applications received in 2017, but this figure was down from 72.2% a decade earlier in 2007 (see figure 4.3). Offices in the upper middle-income group, however, saw their combined share increase from 21.9% in 2007 to 36.9% in 2017, mostly driven by the increase in filings in China. The share held by the lower middle-income group likewise increased, from 5.9% in 2007 to 10.7% in 2017, driven by Morocco, Ukraine and Viet Nam.

Offices in Europe received 39.8% of all plant variety applications in 2017 – less than their share a decade earlier (48.1%) (see figure 4.4). Asia saw its share increase from 22.6% in 2007 to 37.0% in 2017, at the expense of a drop of 4.0 percentage points in North America. Shares for Latin America and the Caribbean (LAC) (7.4%), Africa (2.9%) and Oceania (2.7%) decreased slightly due to Asia's rising share.

Applications grew by 11.7%

Plant varieties

Applicants from China filed the greatest number of applications worldwide

Applications received by offices from resident and non-resident applicants are referred to as office data, whereas applications filed by applicants at a national/regional office (resident applications) or at a foreign office (applications abroad) are referred to as origin data. Here, plant variety statistics based on the origin of residence are reported in order to complement the picture of activity worldwide. Note that for applicants domiciled in European Union (EU) member states, filing at the CPVO regional office is also regarded as a resident filing.

Applicants from China were the most active applicants in the world in 2017, filing 4,041 plant variety applications. This represents a 48.6% growth in filing activity for Chinese applicants – the fastest growth among the top 10 origins. They were followed by applicants from the Netherlands, who filed 3,320 applications. The U.S. (2,084), France (1,068) and Germany (865) were ranked third, fourth and fifth largest origins, respectively (see figure D10). The Netherlands (+6.1%), the U.S. (+2.4%) and France (+1.7%) all saw growth.

While applicants from four of the top five origins filed most of their applications abroad or at the regional office, only those from China filed almost exclusively at home. Similarly, applicants from Japan, the Republic of Korea, the Russian Federation and Ukraine also filed predominantly at their home offices.

Equivalent count

Origin data are compiled using two different counting methods – absolute counts and equivalent counts. The difference between the two lies in the treatment of regional offices data (the CPVO and the African Intellectual Property Organization (OAPI)). For absolute counts, an application received by a regional office is counted only once. For the equivalent count, a single application filed at a regional office is equivalent to multiple applications. To calculate the number of equivalent applications at a regional office in 2017, each application has been multiplied by the corresponding number of member states for the regional office. For CPVO applications, if the applicant resided in one of the 28 EU member states, the application was counted as one resident filing and 27 filings abroad. If the applicant did not reside in an EU member state, the application was counted as 28 filings abroad. The same methodology applies to OAPI member states.

By equivalent count, applicants from the Netherlands filed the most

Equivalent counts take multiple members of a regional office into account. One would expect to see those country origins whose applicants filed intensively at the CVPO move up the ranking when this counting method is applied. Not surprisingly, European countries and the U.S. topped the list of origins based on equivalent counts (see Map 4.5). Applicants from the Netherlands are currently ranked number one, with 39,743 equivalent

Applicants from the Netherlands are ranked in first position under equivalent count measure

4.5. Equivalent plant variety applications by origin, 2017

Source: Map D9.

applications filed worldwide. They were followed by applicants from France (13,191), Germany (9,721) and the U.S. (9,520). China (4,237) was the only other non-European country among the top 10 origins, despite the fact that only 5.5% of its applicants' filings were equivalent filings abroad. This is in marked contrast to the Netherlands, for which the share was 95%.

The number of titles issued decreased for the first time in five years

In 2017, the total number of plant variety titles issued decreased for the first time in five years by 3.8%, declining to 12,780 (see figure 4.6). China accounted for most of this contraction, with titles issued decreasing by 22.8%, while still representing the second largest issuing office with 1,646 titles in total. The CPVO, which issued the largest number of titles (2,865), also experienced a slight decline (-3.9%). The CPVO and the Chinese office were followed by the offices of the U.S. (1,604), Ukraine (887) and Japan (812) (see figure D8). The offices of both Japan (-13.7%) and the U.S. (-5.8%) contributed to the overall decline in titles issued in 2017.

The grant process takes time, so fluctuations in volumes of granted plant variety titles may reflect changes in processing capacities or procedural delays.

Plant variety titles issued decreased by 3.8%

4.6. Plant variety titles issued worldwide, 2003–2017

Source: Figure D2.

Steady growth in plant variety titles in force

Around 126,150 plant variety titles were in force at the end of 2017, up 6.7% on 2017. The CPVO (25,914) and the U.S. (25,238) were the two offices with the highest numbers of active titles (see figure D15). Other offices maintaining at least 4,000 active titles included Japan (8,490), the Netherlands (8,389), Ukraine (8,127), China (7,723), the Republic of Korea (5,064) and the Russian Federation (5,048).

Plant varieties

Plant variety applications and titles issued by office

D3. Plant variety applications by income group, 2007 and 2017

Income group	Number of applications		Resident share (%)		Share of world total (%)		Average growth (%)
	2007	2017	2007	2017	2007	2017	2007–2017
High-income	9,789	9,650	63.9	67.5	72.2	52.2	-0.1
Upper middle-income	2,969	6,825	68.5	76.9	21.9	36.9	8.7
Lower middle-income	792	1,975	49.1	44.3	5.9	10.7	9.6
Low-income	0	40		86.4		0.2	
World	13,550	18,490	64.1	68.5	100.0	100.0	3.2

Note: Totals by income group are WIPO estimates using data covering 69 offices. Each category includes the following number of offices: high-income countries/economies (38), upper middle-income (19), lower middle-income (11) and low-income (1). The EU's Community Plant Variety Office (CPVO) data are allocated to the high-income group because the majority of EU member states are high-income countries. For information on income group classification, see the data description section.

D5. Plant variety applications for the top 20 offices, 2017

Note: CPVO is the Community Plant Variety Office of the European Union. In general, national offices of CPVO member states receive lower volumes of applications because applicants may apply via the CPVO to seek protection within any CPVO member state.
 Source: WIPO Statistics Database, September 2018.

D6. Contribution of resident and non-resident applications to total growth for the top 20 offices, 2016–2017

Note: CPVO is the Community Plant Variety Office of the European Union. This figure shows total growth in plant variety applications, broken down by the respective contributions of resident and non-resident filings. For example, applications in Japan grew by 4.3%, and resident applications contributed 0.2 percentage points to this total growth while non-resident applications accounted for the other 4.1 percentage points.
 Source: WIPO Statistics Database, September 2018.

D7. Plant variety applications for offices of selected low- and middle-income countries, 2017

Note: OAPI is the African Intellectual Property Organization. The selected offices are from different world regions and income groups. Where available, data for all offices are presented in the statistical table at the end of this section.

Source: WIPO Statistics Database, September 2018.

D8. Plant variety titles issued by the top 20 offices, 2017

Note: CPVO is the Community Plant Variety Office of the European Union. The procedure for issuing titles varies between offices, and differences in the numbers of titles issued between offices depend on factors such as examination capacity and procedural delays, so there is a time lag between application and title issue dates. For this reason, data on applications for a given year should not be compared with data on titles issued for the same year.

Source: WIPO Statistics Database, September 2018.

Plant variety applications and titles issued by origin

D9. Equivalent plant variety applications by origin, 2017

Note: Equivalent plant variety applications by origin include resident applications and applications filed abroad. The origin of an application is determined by the residence of the applicant. Applications filed at regional offices are considered equivalent to multiple applications in the relevant member states. See the glossary for the definition of equivalent application.

Source: WIPO Statistics Database, September 2018.

D10. Plant variety applications for the top 20 origins, 2017

Note: Data are based on absolute count, not equivalent count. Applications by origin include resident applications and applications filed abroad. The origin of an application is determined by the residence of the applicant. Regional refers to applications filed at the EU's Community Plant Variety Office.

Geographical indications

In 2017, for the first time, WIPO published statistics on geographical indicators (GIs) in force covering data for 54 jurisdictions. Data were collected from national and regional intellectual property (IP) offices and other competent authorities using three questionnaires.

In 2018, WIPO revised the GI questionnaire and invited national/regional authorities to share their latest GIs in force data with WIPO. In total, 82 authorities responded, which is a considerable improvement on the 54 responses that WIPO received in the previous year. Furthermore, a number of authorities reviewed their previous data submissions and revised their data in order to provide a more comprehensive and refined perspective of GIs in force within their jurisdictions.

It is important to note that GIs can be protected through a variety of legal means (e.g., *sui generis* systems, trademark laws, international agreements, other national legal means, etc.). This can make it challenging to obtain a complete picture of all GIs protected in any particular country. WIPO has made substantial efforts to gather data from all sources. Notwithstanding the improvements mentioned above, in many instances it has not been possible to obtain data from every source. Nonetheless, these statistics offer some insight into how this form of IP is used in different parts of the world.

With the support of its member states, WIPO hopes to improve the geographical coverage and completeness of GI statistics in the coming years.

How many GIs are in force worldwide?

Data received from the 82 national/regional authorities that shared their 2017 data with WIPO reveals the existence of approximately 59,500 protected GIs. This figure excludes the 4,932 European Union (EU) GIs in force in each of the EU member states in order to minimize double counting. The 4,932 EU GIs in force are counted once rather than as 4,932 multiplied by 28 member states.

Figure 5.1 shows the total number of GIs in force for each selected national/regional authority, while figure 5.2 reports data on GIs in force for the EU member states. Germany had the largest number of GIs in force (14,073), followed by Austria (8,749), China (8,507), Hungary (6,646), Czech Republic (6,191), Bulgaria (6,096) and Italy (5,977). Apart from Bulgaria and China, there are several middle-income countries with a large number of GIs in force within their respective jurisdictions. For example, there were 4,615 GIs in force in the Republic of Moldova in 2017, 3,415 in Bosnia and Herzegovina and 3,112 in Ukraine. India (305) and Brazil (63) – two of the large middle-income countries – have considerably lower numbers of GIs in force.

GIs in force relating to “wines and spirits” accounted for 57.1% of the 2017 total, followed by agricultural products and foodstuffs (28.2%) (see figure 5.3). Handicrafts accounted for 2.7% of the total. China, Hungary, India and the Islamic Republic of Iran each had more than 100 GIs for handicrafts in force within their jurisdictions.

China had more than 8,500 GIs in force

5.1. Geographical indications in force for selected national/regional authorities, 2017

Note: * indicates 2016 data.

Source: WIPO Statistics Database, September 2018.

GIs in force based on national systems accounted for 65% of total GIs in Germany

5.2. Geographical indications in force for EU member states, 2017

Note: This figure shows the total number of geographical indications in force in the EU member states, broken down by GIs in force based on the EU regional systems and agreements and on national systems. The EU has regional systems for the protection of GIs covering agricultural and foodstuff products, wines and spirits.

Source: WIPO Statistics Database, September 2018.

Wine and spirits accounted for 57.1% of GIs in force

5.3. Geographical indications in force by product categories, 2017

Note: GIs in force through the EU regional systems are counted once rather than 28 times as they are in force in all EU member states. This is done to minimize double counting.

Source: WIPO Statistics Database, September 2018.

These figures should be interpreted with caution, however. Not only are the data limited to the 82 countries that shared their 2017 data with WIPO, but the submissions made by many countries were incomplete. The questionnaire underlying the data collection asked for information regarding GIs protected through *sui generis* systems, trademark systems, other national legal means, regional systems and international agree-

ments (including GIs in force under the Lisbon System and the Madrid System). As can be seen from table 5.4, many countries were unable to provide statistics on the number of GIs protected through trademark systems, reflecting the difficulty of identifying such GIs among all trademarks (most commonly collective and certification trademarks) registered. In addition, several countries could not provide data on the number of GIs protected through international agreements. Finally, there is likely to be double-counting of GIs protected through two or more legal means.¹

Use of the Lisbon System to protect appellations of origin

The Lisbon System consists of 28 member countries, seven of which are European Union members. In 2017, there were 991 appellations of origin in force via the Lisbon System (see figure 5.5). This represents a 3.7% increase on the previous year, which is mostly driven by strong growth from Italy. France remains the largest user of the Lisbon System. It accounted for 51.4% of the 2017 total, followed by Italy (17%), Czech Republic (7.6%), Bulgaria (5.1%) and the Islamic Republic of Iran (4.1%).

¹ In principle, double-counting of the same subject matter protected by different IP rights also occurs in patent, trademark and industrial design statistics. However, the inclusion of GIs covered in trade agreements adds a layer of complexity, as relevant GIs may, in some cases, only have legal effect once registered at the national level.

Creative economy

Highlights

In 2016, the International Publishers Association (IPA) and the World Intellectual Property Organization (WIPO) joined forces to improve the availability of statistics on global publishing activity. Accordingly, the two organizations launched a pilot survey in 2017, covering three market segments: trade; educational; and scientific, technical and medical (STM) publishing. In total, 35 national publishers' associations and copyright authorities shared their 2016 data.¹

In April 2018, WIPO refined the guidelines for completing the questionnaire and invited national publishers' associations and copyright authorities to share their 2017 data. In total, 28 associations/authorities complied, while another 10 indicated that they would share their 2017 data when they are available. This section summarizes the statistics received so far. The full set of 2017 statistics will be published at a later date.

It is important to note that, unlike for patents and trademarks, the collection of publishing industry data is not unified under a single public authority within a country. In most countries, national statistical offices or other government agencies do not collect such data, although there are a few exceptions, such as Canada, China and Japan. Data for the publishing industry are compiled by private entities and national publishers' associations (NPAs), among others. The main limitation with NPA data is that not all the publishers within a country are members of the NPA. The share of the total publishing industry represented by NPAs varies

between countries. There are also methodological differences – for example, some of the NPAs collect data for printed editions only, while others compile data for both printed and digital editions – which makes it challenging to draw comparisons between countries. Despite the data limitations – i.e., the fact that the data are incomplete, this initiative should be considered as a longer term effort toward the creation of a more comprehensive publishing industry data set. The ultimate objective is to provide, on a regular basis, accurate statistics that are comparable between countries. WIPO will continue to make every effort to improve data comparability and extend country coverage by reaching out to countries that are not in a position to respond to the questionnaire at present.

China's publishing industry revenue reached 202 billion U.S. dollars in 2017

Data on the 2017 revenues generated by the three sectors – trade, educational and STM – are available for 11 countries. Those 11 countries generated USD 248 billion revenue in 2017. China (USD 202.4 billion) reported the largest net revenue, followed by the United States of America (U.S.) (USD 25.9 billion), Germany (USD 5.8 billion) and the United Kingdom (U.K.) (USD 4.7 billion) (see figure 6.1). Trade sector revenue accounted for 50% or more of the total revenue in seven of those same 11 countries – ranging from 69% in France to 50% in the U.K. The educational sector revenue accounted for a high share of total revenue in Yemen (68.2%) and Brazil (62%). The STM sector generated more than a third of total revenue in Belgium (46.1%), Brazil (37.9%) and the U.K. (33.2%).

Net publishing industry revenue, covering 11 countries, amounted to USD 248 billion

Digital editions generated 28.3% of the total trade sector revenue in China

Data on the 2017 revenues generated by the trade sector are available for 18 countries. China, with USD 111.5 billion, reported the largest revenue, followed by the U.S. (USD 16 billion), Japan (USD 8.4 billion), the U.K. (USD 2.4 billion) and France (USD 2.1 billion) (see figure F1).

Data on the 2017 trade sector revenues, broken down into the categories “printed”, “digital” and “other formats,” are available for 15 countries. The bulk of the trade sector revenue is generated by print editions; digital editions account for around 28.3% of the total in China, 23.5% in Japan, 18.4% in Sweden, 13.2% in Finland and 12.9% in the U.S. (see figure F2). Domestic sales account for the bulk of total revenue for most countries. However, revenue from foreign sales and licensing represents 81.4% of total revenue in Belgium (see figure F3). Revenue from foreign sales is also high in Saudi Arabia (49.4%), the U.K. (31.4%), China (23.4%) and Spain (16.4%).

Foreign sales accounted for 69.8% of total educational sector revenue of the U.K.

Data on the 2017 revenues generated by the educational sector are available for 15 countries. China, with USD 72.8 billion, reported the largest sale and license revenue total, followed by the U.S. (USD 7.6 billion) and Spain (USD 1 billion) (see figure F8). The bulk of the total educational sector revenue is generated by printed editions. Digital editions accounted for 37.8% of the total

in China, 29.6% in Denmark, 9.5% in Finland and 9.1% in Saudi Arabia (see figure F9). The 2017 educational sector revenue, broken down by domestic and foreign sales, is available for nine countries. Domestic sales account for the bulk of the total revenue for all countries except the U.K., for which foreign sales accounted for 69.8% of the total (see figure F10).

China published 65 million titles covering three sectors in 2017

Data on the total number of titles published covering the three sectors are available for 17 countries. China reported a combined total of 65 million published titles in 2017, followed by Japan (2 million), Spain (119,778), France (104,670) and Turkey (104,283) (see figure 6.2). The trade sector accounted for more than half of all titles published in 10 of those countries – ranging from 99.3% in Japan to 55.9% in Turkey. Educational publishing accounted for around half of all titles published in Belarus (50.9%), Yemen (49.3%) and China (43%). The STM sector accounted for almost two-thirds of all titles published in Belgium.

Digital editions accounted for half of the total number of titles published by the trade sector in Japan

Data on the number of titles published by the trade sector are available for 22 countries. China had by far the largest number of titles published in 2017 (12.7 million), followed by Japan (2 million), Italy (130,242) and Spain (82,238) (see figure F4). In total, 13 countries were able

China published 65 million titles, covering the trade, educational and STM sectors

6.2. Total number of titles published, 2017

* indicates 2016 data.

Source: Table F18.

to disaggregate the number of titles published by the trade sector between printed editions, digital editions and other formats. Print editions accounted for more than half of the total number of titles published for the trade sector. The share of digital editions was high in Japan (49.9%) and Italy (47.8%) (see figure F5).

Data on the number of titles published by the educational sector are available for 19 countries. China had by far the largest number of titles published (27.9 million), followed by Turkey (35,642) and Brazil (11,060) (see figure F11). The number of titles published by the STM sector was highest in China (24.4 million), followed by Spain (26,656), France (20,246) and Brazil (13,406) (see figure F16).

The U.S. sold 2,693 million copies of published titles in 2017

Eleven countries were able to report data on the total number of copies sold covering the three sectors. The U.S. sold 2,693 million copies in 2017, followed by the U.K. (647 million), Brazil (617 million) and France (430 million) (see figure 6.3). The trade sector accounted for more than 80% of the total copies sold for France, Norway and the U.S. The educational sector had a high share of total copies sold in Yemen (73.3%) and Turkey (48.8%), while the STM sector had a high share in Yemen (16.7%), the Republic of Moldova (14.7%) and Spain (11.5%).

Additional information

Data description

Spanish at www.wipo.int/ipstats/en/data_collection/questionnaire.

Data sources

Intellectual property (IP) data are taken from the WIPO Statistics Database and are based primarily on WIPO's annual IP statistics survey (see below) and on data compiled by WIPO in processing international applications/registrations through the Patent Cooperation Treaty (PCT) and the Madrid and Hague Systems.

Data are available from WIPO's Statistics Data Center at www.wipo.int/ipstats.

Patent family and technology data are extracted from the WIPO Statistics Database and from the 2018 spring edition of the European Patent Office's PATSTAT database.

Gross domestic product and population data are from the World Bank's World Development Indicators database.

This report uses the World Bank's income classifications. Economies are classified according to 2017 gross national income per capita, calculated using the World Bank Atlas method. The classifications are low-income (USD 995 or less), lower middle-income (USD 996 to USD 3,895), upper middle-income (USD 3,896 to USD 12,055) and high-income (over USD 12,056).

This report uses United Nations (UN) definitions of regions and sub-regions, although the geographical terms used in the report may differ slightly from those defined by the UN.

WIPO's annual IP statistics surveys

WIPO collects data from national/regional IP offices, other competent authorities and publishers' associations around the world through annual surveys consisting of multiple questionnaires and enters these data into the WIPO Statistics Database. When possible, data published on IP offices' websites or in annual reports are used to supplement questionnaire responses in cases where IP offices/countries do not provide statistics. Continuous efforts are made to improve the quality and availability of IP statistics and to gather data for as many IP offices and countries as possible.

WIPO's long-established regular IP survey covers patents, utility models, trademarks, industrial designs and plant varieties. This survey consists of 28 questionnaires, which are available in English, French and

In 2016, WIPO initiated a pilot survey to collect data on GIs in force. In 2017, for the first time, WIPO published statistics on GIs in force covering data for 54 jurisdictions. Data were collected from national and regional IP offices and other competent authorities through three questionnaires. For the 2018 survey, WIPO reduced the number of GI questionnaires from three to one and invited national/regional authorities to share their 2017 data on GIs in force with WIPO. In total, 82 authorities responded, which is a considerable improvement on the 54 responses that WIPO received in 2016.

In 2017, in collaboration with the International Publishers Association (IPA), WIPO launched a new survey of the global publishing industry. A total of 35 national publishers' associations and copyright authorities shared their 2016 data with the IPA and WIPO. The survey only includes published materials (i.e., books, journals, etc.) that have an International Standard Book Number (ISBN), International Standard Serial Number (ISSN) or Digital Object Identifier (DOI). The data collected through this new survey were presented in *The Global Publishing Industry in 2016* (published in April 2018) available to download at www.wipo.int/ipstats. In 2018, the publishing industry survey was sent to national publishers' associations and copyright authorities inviting them to share their 2017 data. To date, 28 associations/authorities have shared their 2017 data with the IPA and WIPO.

IP office survey coverage

IP offices are requested to report data by the origin (country or territory) of applications, grants or registrations. However, some offices are unable to provide a detailed breakdown. Instead, these offices report either an aggregate total or a simple breakdown by total resident and total non-resident counts. For this reason, the totals for each origin are underreported. However, the unknown origin shares of the 2017 totals are low – only 0.8% for patent applications, 0.8% for trademark application class counts and 0.7% for application design counts.

IP applications data coverage by IP type

IP type	Number of offices on which 2017 world totals are based	Number of offices for which 2017 data are available	Data coverage (%)
Patents	156	120	99.5
Utility models	75	64	99.9
Trademarks (a)	164	117	97.9
Industrial designs (b)	151	122	99.5
Plant varieties	69	62	97.8

(a) Refers to the number of trademark applications based on class count (that is, the number of classes specified in applications).

(b) Refers to the number of industrial design applications based on design count (that is, the number of designs contained in applications).

Estimating world totals

World totals for applications for, and grants/registrations of, patents, utility models, trademarks, industrial designs and plant varieties are WIPO estimates. Data are not available for all IP offices for every year. Missing data are estimated using methods such as linear extrapolation and averaging adjacent data points. The estimation method used depends on the year and office in question. When an office provides data which are not broken down by origin, WIPO estimates the resident and non-resident counts using the historical shares of that office. Data are available for most of the larger offices; only small shares of world totals are estimated. For example, the estimate of the total number of patent applications worldwide covers 156 offices. Data are available for 120 of them, which account for 99.5% of the estimated world total.

National and international data

Application and grant/registration data include data on both direct filings and filings through WIPO-administered international systems (where applicable). For patents and utility models, data include direct filings at national patent offices as well as PCT national phase entries. For trademarks, data include filings at national and regional offices and designations received by relevant offices through the Madrid System. For industrial designs, data include national and regional applications combined with designations received by relevant offices through the Hague System.

International comparability of indicators

Every effort has been made to compile IP statistics based on the same definitions and to facilitate international comparability. Although data are collected from offices using questionnaires from WIPO's harmonized annual IP survey, national laws and regulations for filing IP applications or for issuing IP rights, as well as statistical reporting practices, may differ between jurisdictions. Due to continual updating of data and the revision of historical statistics, data in this report may differ from data in previous editions and from data available on WIPO's website.

Change in method of counting IP applications by CNIPA

Due to a change in the method by which the National Intellectual Property Administration of the People's Republic of China (CNIPA) calculates the number of patent, utility model and industrial design applica-

tions filed, data on the number of such applications filed in China in 2017 are not comparable with data for previous years. Prior to 2017, these data included all applications received; however, from 2017 onwards, they only include applications for which the office has received the necessary application fees. As a result, it is not meaningful to report growth rates in the number of patent, utility model and industrial design applications filed in China in 2017 compared to 2016. Moreover, since China represents such a large share of IP applications globally, it is not meaningful to report growth rates in the number of such applications filed worldwide in 2017 compared to 2016.

CNIPA has reported a growth rate of 14.2% in the number of patent applications filed in 2017 compared to 2016, without any breakdown between resident and non-resident filings. The 14.2% growth rate is calculated based on the new method. Recalculating the number of patent applications filed in China in 2016 according to the new method suggests an estimated growth rate of 5.8% in the number of patent applications filed worldwide in 2017 compared to 2016.

This report provides long-term average growth rates in the number of patent, utility model and industrial design applications, as it is expected that the impact of the change in methodology described above will be relatively limited in the long run.

IP systems at a glance

The patent system

A patent is a set of exclusive rights granted by law to applicants for an invention that meets the standards of novelty, non-obviousness and industrial applicability. It is valid for a limited period (generally 20 years), during which time the patent holder can commercially exploit the invention on an exclusive basis. In return, applicants are obliged to disclose their inventions to the public, so that others skilled in the art may replicate them. The patent system is designed to encourage innovation by providing innovators with time-limited exclusive legal rights, thus enabling them to appropriate the returns from their innovative activity.

The procedures for acquiring patent rights are governed by the rules and regulations of national and regional patent offices. These offices are responsible for issuing patents and the rights are limited to the jurisdiction of the issuing authority. To obtain patent rights, applicants must file an application describing the invention with a national or regional office.

Applicants can also file an international application through the Patent Cooperation Treaty (PCT) System, an international treaty administered by WIPO that facilitates the acquisition of patent rights in multiple jurisdictions. The PCT System simplifies the process of multiple national patent filings by delaying the requirement to file a separate application in each jurisdiction in which protection is sought. However, the decision on whether to grant a patent remains the prerogative of national or regional patent offices and patent rights are limited to the jurisdiction of each patent-granting authority.

The PCT application process begins with the international phase, during which an international search and optional preliminary examination and supplementary international search are performed. It concludes with the national phase, during which national (or regional) patent offices decide on the patentability of an invention according to national law. Further information about the PCT System is available at www.wipo.int/pct.

The utility model system

Like a patent, a utility model (UM) confers a set of rights to an invention for a limited period, during which the UM rights holder can commercially exploit their invention on an exclusive basis. The terms and condi-

tions for granting a UM differ from those for granting a traditional patent. For example, UMs are issued for a shorter period (6–10 years) and at most offices protection is granted without substantive examination. As with patents, procedures for granting UM rights are governed by the rules and regulations of national intellectual property (IP) offices and rights are limited to the jurisdiction of the issuing authority.

Approximately 75 countries provide protection for UMs. In this report, the term “utility model” refers to UMs and other types of protection similar to UMs, such as innovation patents in Australia and short-term patents in Ireland.

Microorganisms under the Budapest Treaty

The Budapest Treaty on the International Recognition of the Deposit of Microorganisms for the Purposes of Patent Procedure plays an important role in relation to biotechnological inventions. Disclosing an invention is a generally recognized requirement for receiving a patent. When an invention involves microorganisms, national laws in most countries require the applicant to deposit a sample at a designated International Depository Authority (IDA).

To eliminate the need to deposit a microorganism in every country in which patent protection is sought, the Budapest Treaty provides that depositing a microorganism with any IDA will suffice for the purposes of patent procedures at national patent offices of all contracting states and at regional patent offices that recognize the treaty. An IDA is a scientific institution – typically a “culture collection” – capable of storing microorganisms. Currently, there are 47 IDAs around the world. Further information about the Budapest Treaty is available at www.wipo.int/treaties/en/registration/budapest.

The trademark system

A trademark is a distinctive sign that identifies certain goods or services as those produced or provided by a specific person or enterprise. Trademarks can be registered for both goods and services. In the latter case, the term “service mark” is sometimes used. For simplicity, this report uses “trademark” regardless of whether the registration concerns goods or services. The holder of a registered trademark has the exclusive right to use the mark in relation to the goods or services for which it is registered and can block unauthorized use of the trademark, or a confusingly similar mark, to prevent consumers from being misled. Unlike patents, trademark registrations can be maintained indefinitely,

provided that the trademark holder pays the required renewal fees.

The procedures for registering trademarks are governed by the rules and regulations of national and regional IP offices. Therefore, trademark rights are limited to the jurisdiction of the authority in which a trademark is registered. Trademark applicants can file an application with the relevant national or regional IP office or an international application through the Madrid System. However, when an applicant files internationally via the Madrid System, the decision to issue a trademark registration remains the prerogative of the national or regional IP office concerned and trademark rights remain limited to the jurisdiction of the authority issuing that registration.

Originally, two treaties administered by WIPO governed the Madrid System for the International Registration of Marks. These treaties are the Madrid Agreement Concerning the International Registration of Marks and the Protocol Relating to the Madrid Agreement, and are jointly referred to as the Madrid System. The Madrid Agreement was concluded in 1891 and the Madrid Protocol came into operation in 1996. With Algeria's accession to the Madrid Protocol in October 2015, the last remaining member to be a party only to the Madrid Agreement joined the Protocol, effectively making Madrid a one-treaty system. The Madrid System offers many advantages to both trademark holders and IP offices compared with the alternative method of obtaining international protection for marks, which is called the Paris or direct route. The Paris route involves filing separate applications in a number of countries or regions using rights established under the Paris Convention for the Protection of Industrial Property. In contrast, the Madrid System allows trademark holders to submit a single application in one language while paying a single set of fees in one currency.

The System also simplifies subsequent management of the trademark, since it is possible to centrally request and record further changes, or to renew the registration through a single procedure. A registration recorded in the International Register yields the same effect as a registration made directly with each designated Contracting Party (Madrid member) if the competent authority of that jurisdiction has not issued a refusal within a specified time limit. Further information about the Madrid System is available at www.wipo.int/madrid.

The industrial design system

Industrial designs are applied to a wide variety of industrial products and handicrafts.¹ They refer to the ornamental or aesthetic aspects of a useful article,

including compositions of lines or colors or three-dimensional forms that give a special appearance to a product or handicraft. The holder of a registered industrial design has exclusive rights over the design and can prevent unauthorized copying or imitation of the design by others.

The procedures for registering industrial designs are governed by national or regional laws. An industrial design can be protected if it is new or original and rights are limited to the jurisdiction of the issuing authority. Registrations can be obtained by filing an application with a relevant national or regional IP office or by filing an international application through the Hague System. Once a design is registered, the term of protection is generally five years and may be renewed for additional periods of five years up to a total of 15 years in most cases. In some countries, industrial designs are protected through the delivery of a design patent rather than design registration.

The Hague System comprises two international treaties – the Hague Act and the Geneva Act. The System makes it possible for an applicant to register industrial designs in multiple countries by filing a single application with the International Bureau of WIPO, thus simplifying the multinational registration process. Moreover, by allowing the filing of up to 100 different designs per application, the System offers considerable opportunities for efficiency gains. It also streamlines the subsequent management of industrial design registration, since it is possible to record changes or renew a registration through a single procedure. Further information about the Hague System is available at www.wipo.int/hague.

Plant variety protection

To obtain protection, a plant breeder must file an individual application with each authority entrusted with granting breeders' rights. A breeder's right is granted only when a variety is new, distinct, uniform and stable, and has a suitable denomination.

In the United States of America (U.S.), two legal frameworks protect new plant varieties: the Plant Patent Act (PPA) and the Plant Variety Protection Act (PVPA). Under the PPA, whoever invents or discovers and asexually reproduces any distinct and new variety of plant – including cultivated sports, mutants, hybrids and newly found seedlings, other than a tuber-propagated plant (in practice, Irish potato and Jerusalem artichoke) or a plant found in an uncultivated state – may obtain a patent. Under the PVPA, the U.S. protects all sexually reproduced plant varieties and tuber-propagated plant varieties, excluding fungi and bacteria.

Protection of geographical indications

A geographical indication (GI) is a sign identifying a good as originating in a specific geographical area and possessing a given quality, reputation or other characteristic that is essentially attributable to that geographical origin. Thus, the main function of a GI is to indicate a connection between that quality, characteristic or reputation of the good and its territory of origin.

World-renowned examples of GIs include Café de Colombia (Colombia), Bordeaux (France), Kampot Pepper (Cambodia), Penja Pepper (Cameroon) and Scotch whisky (U.K.).

GIs are mainly used for agricultural and food products, which typically tend to have a close natural link with their place of origin. There are, however, also many GIs for other kinds of products. The specific qualities of the product may derive from traditional manufacturing skills or from a combination of local know-how and natural resources. Examples of such GIs include Bohemia Crystal (Czech Republic), Solingen Cutlery (Germany), Isfahan Handmade Carpet (Islamic Republic of Iran), Swiss Watches (Switzerland) and Yangzhou Lacquerware (China).

Although GIs are commonly names of places, under many systems they may consist of non-geographical terms with a traditional geographical connotation. Reblochon (France) and Argane (Morocco) serve as GIs although they are not geographical names.

Geographical indications can only be used by producers whose goods conform to the applicable requirements concerning the area of origin, processing method and typicity of the product. Production sites located outside the area of origin and goods that do not meet the applicable requirements are prevented from using the protected indication.

Appellations of origin

An appellation of origin is a special kind of geographical indication. It generally consists of a geographical name or a traditional denomination which serves to designate a product as originating therein, where the quality or characteristics of the product are due exclusively or essentially to the geographical environment, including natural and human factors, and which have given the good its reputation. The most important difference between appellations of origin and other GIs is that the link with the place of origin should be stronger in the case of an appellation of origin. In other words, appellations of origin are a more restrictive sub-category of GIs.

Protection of GIs

At the national and regional levels, GIs are protected through a variety of legal means. These include *sui generis* systems – laws specifically designed to protect geographical indications,² often based on a registration procedure. *Sui generis* systems generally provide protection against any direct and indirect commercial use of the GI as well as against its imitation. *Sui generis* systems for GI protection are used in many countries and also by two regional intergovernmental organizations: the African Intellectual Property Organization (OAPI) and the European Union (EU).

GIs are also protected on the basis of trademark law, commonly through the use of collective and certification marks. Because trademarks incorporating geographical terms are typically not recorded by IP offices as a separate category of trademarks, and because not all trademarks incorporating geographical terms can be considered to be GIs, it may be difficult to determine the exact number of registered GIs within those jurisdictions. It is also worth noting that GI protection via trademark and *sui generis* systems are not mutually exclusive but often coexist, under many legal frameworks, and are available to the benefit of GI holders.

Finally, GIs are typically also protected under unfair competition regulation, consumer protection laws and administrative and judicial decisions, as well as under specific laws or decrees recognizing individual GIs.

The effects of a GI right obtained in a particular jurisdiction are limited to the territory of that jurisdiction. Thus, where a right over a GI is obtained in one jurisdiction, it is protected there but not abroad. In order to obtain protection in a foreign jurisdiction, GI holders must, in principle, seek protection under the relevant national laws prevailing in the jurisdiction in question. However, international agreements can facilitate the acquisition of GI rights abroad. In particular, many bilateral and regional trade agreements have incorporated lists of GIs that are to be protected in the relevant parties to the agreement. The listed GIs may relate to existing or subsequent registrations of GI rights, but protection may also emanate from the trade agreements themselves.

Another way of obtaining protection for GIs abroad is through two international registration systems administered by WIPO: the Lisbon System and the Madrid System.

The Lisbon System

The Lisbon System was established in 1958 to facilitate the international protection of appellations of origin through a single registration procedure.³ Registration with the WIPO International Bureau ensures protection

in all Lisbon contracting parties, without the need for renewal and as long as the appellation of origin remains protected in its contracting party of origin. However, the decision on whether to protect a newly registered appellation of origin at the national level remains the prerogative of each contracting party and each Lisbon member can refuse protection based on any ground within one year of being notified of a new appellation of origin by the WIPO International Bureau. The Lisbon System is flexible with regard to the means by which countries may provide protection for the registered appellation of origin (e.g., *sui generis* systems, trademark laws or specific ad hoc decrees, as well as judicial and administrative decisions).

Globally-renowned examples of appellations of origin protected under the Lisbon System include Tequila (Mexico), Chianti for wines (Italy), Habanos for cigars (Cuba) and handicrafts such as Chulucanas for ceramics (Peru), Herend for porcelain (Hungary) and Kraslice musical instruments (Czech Republic). The scope of the System extends to non-geographical traditional names, such as Reblochon (France) and Vinho Verde (Portugal).

In 2015, with the adoption of the Geneva Act of the Lisbon Agreement on Appellations of Origin and Geographical Indications, which will enter into force after five ratifications or accessions, Lisbon contracting parties modernized the System to attract a wider membership, while preserving its principles and objectives. The Geneva Act formally extends the scope of the Lisbon System to the general category of geographical indications in addition to appellations of origin. The new Act also opens the Lisbon System to accession by intergovernmental organizations such as the EU and OAPI.

Protection of GIs abroad through the Madrid System

GIs can also be protected in several countries as trademarks (most commonly collective and certification marks) through the Madrid System, an international registration system legally governed by the Madrid Agreement (1891) and the Madrid Protocol (1989) and administered by WIPO.⁴ Famous examples of collective and certification marks registered under the Madrid System include Napa Valley for wine (U.S.) and Parmigiano Reggiano for cheese (Italy). As at June 2017, there were more than 1,200 collective and certification marks registered under the Madrid System. However, collective and certification marks protecting GIs are not separately recorded, so it is difficult to determine their exact number.

- 1 The products and handicrafts to which industrial designs are applied range from technical and medical instruments to watches, jewelry and other luxury items, and from housewares, electrical appliances, vehicles and construction materials to textile designs and leisure goods.
- 2 The terminology used at national and regional levels to refer to *sui generis* rights over GIs is not uniform. Different terms, such as appellations of origin, controlled appellations of origin, protected designations of origin, protected geographical indications, (qualified) indications of source or simply geographical indications are used in different legislations. Despite the different terminology, however, the common denominator remains the link between the specific quality, characteristics or reputation of the product and its territory of origin. For simplicity, the present text generally uses “geographical indication (GI)” regardless of the different national and regional terminology.
- 3 The Lisbon System is administered by WIPO and comprises the Lisbon Agreement for the Protection of Appellations of Origin and their International Registration (1958), as revised at Stockholm in 1967 and amended in 1979, and the Geneva Act of the Lisbon Agreement on Appellations of Origin and Geographical Indications (2015), which has not yet entered into force.
- 4 For more information about the Madrid System, please see the *Madrid Yearly Review 2018*.

Glossary

This glossary provides definitions of key technical terms and concepts. Many of these terms are defined generically (for example, “application”) but apply to several or all of the various forms of intellectual property (IP) covered in this report.

Applicant

An individual or other legal entity that files an application for a patent, utility model, trademark or industrial design. There may be more than one applicant in an application. For the statistics in this publication, the name of the first named applicant is used to determine the origin of the application.

Application

The procedure for requesting IP rights at an office, which then examines the application and decides whether to grant protection. Also refers to a set of documents submitted to an office by the applicant.

Application abroad

For statistical purposes, an application filed by a resident of a given state or jurisdiction with the IP office of another state or jurisdiction. For example, an application filed by an applicant domiciled in France with the Japan Patent Office (JPO) is considered an application abroad from the perspective of France. This differs from a “non-resident application,” which describes an application filed by a resident of a foreign state or jurisdiction from the perspective of the office receiving the application: the example above would be a non-resident application from the JPO’s point of view.

Application date

The date on which the IP office receives an application that meets the minimum requirements. Also referred to as the filing date.

Budapest Treaty

Disclosure of an invention is a requirement for granting a patent. Normally, an invention is disclosed by means of a written description. Where an invention involves a microorganism or the use of a microorganism, disclosure is not always possible in writing but can sometimes only be effected by depositing a sample of the microorganism with a specialized institution. To eliminate the need to deposit a microorganism in each country in which patent protection is sought, the Budapest Treaty provides that the deposit of a microorganism with any International Depositary Authority (IDA) suffices for the purposes of patent procedure at the national patent offices of all contracting states and at any regional patent office that recognizes the treaty.

Certification trademark

Certification marks are usually given for compliance with defined standards but are not confined to any membership. They may be used by anyone who can certify that the products involved meet certain established standards. In many countries, the main difference between collective marks and certification marks is that collective marks may only be used by a specific group of enterprises, for example, members of an association, while certification marks may be used by anybody who complies with the standards defined by the owner of the certification mark.

Class

May refer to the classes defined in either the Locarno Classification or the Nice Classification. Classes indicate the categories of goods and services (where applicable) for which industrial design or trademark protection is requested. See “Locarno Classification” and “Nice Classification.”

Class count

The number of classes specified in a trademark application or registration. In the international trademark system and at certain national and regional offices, an applicant can file a trademark application that specifies one or more of the 45 goods and services classes of the Nice Classification. Offices use a single- or multi-class filing system. For example, the offices of Japan, the Republic of Korea and the United States of America (U.S.), as well as many European IP offices, have multi-class filing systems. The offices of Brazil, Mexico and South Africa follow a single-class filing system, requiring a separate application for each class in which an applicant seeks trademark protection. To capture the differences in application and registration numbers across offices, it is useful to compare their respective application and registration class counts.

Collective trademark

Collective marks are usually defined as signs which distinguish the geographical origin, material, mode of manufacture or other common characteristics of goods or services of different enterprises using the collective mark. The owner may be either an association of which those enterprises are members or any other entity, including a public institution or a cooperative.

Community Plant Variety Office (CPVO) of the European Union (EU)

An EU agency that manages a system of plant variety rights covering all EU member states.

Design count

The number of designs contained in an industrial design application or registration. Under the Hague System for the International Registration of Industrial Designs, it is possible for an applicant to obtain protection for up to 100 industrial designs for products belonging to one and the same class by filing a single application. Some national or regional IP offices allow applications to contain more than one design for the same product or within the same class, while others allow only one design per application. In order to capture the differences in application and registration numbers across offices, it is useful to compare their respective application and registration design counts.

Designation

The request in an international application or registration by which the applicant/international registration holder specifies the jurisdiction(s) in which they seek to protect their industrial designs (Hague System) or trademarks (Madrid System).

Direct filing

See “National route.”

Equivalent application

Applications at regional offices are equivalent to multiple applications, one in each of the states that is a member of those offices. To calculate the number of equivalent applications for the Benelux Office for Intellectual Property (BOIP), the Eurasian Patent Organization (EAPO), the African Intellectual Property Organization (OAPI), the Patent Office of the Cooperation Council for the Arab States of the Gulf (GCC Patent Office) and the European Union Intellectual Property Office (EUIPO), each application is multiplied by the corresponding number of member states. For European Patent Office (EPO) and African Regional Intellectual Property Organization (ARIPO) data, each application is counted as one application abroad if the applicant does not reside in a member state or as one resident application and one application abroad if the applicant resides in a member state. The equivalent application concept is used for reporting data by origin.

Equivalent grant (registration)

Grants (registrations) at regional offices are equivalent to multiple grants (registrations), one in each of the states that is a member of those offices. To calculate the number of equivalent grants (registrations) for BOIP, EAPO, the EUIPO, the GCC Patent Office or OAPI, each grant (registration) is multiplied by the corresponding number of member states. For EPO and ARIPO data, each grant is counted as one grant abroad if the applicant does not reside in a member state or as one resident grant and one grant abroad if the applicant resides in a member state. The equivalent grant (registration) concept is used for reporting data by origin.

European Patent Office (EPO)

The EPO is the regional patent office created under the European Patent Convention (EPC), in charge of granting European patents for EPC member states. Under Patent Cooperation Treaty (PCT) procedures, the EPO acts as a receiving office, an International Searching Authority and an International Preliminary Examining Authority.

European Union Intellectual Property Office (EUIPO)

The EUIPO is the office responsible for managing the EU trademark and the registered community design. The validity of these two intellectual property rights extends across the jurisdictions of the EU's 28 member states.

Filing

See “Application.”

Foreign-oriented patent families

A special subset of patent families that comprises foreign-oriented patent families: this includes only patent families that have at least one filing office which differs from the office of the applicant's country of origin. Some foreign-oriented patent families include only one filing office, because applicants may choose to file directly with a foreign office. For example, if a Canadian applicant files a patent application directly with the United States Patent and Trademark Office (USPTO) without previously filing with the patent office of Canada, that application and applications filed subsequently with the USPTO will form a foreign-oriented patent family.

Geographical indication

A geographical indication (GI) is a sign identifying a good as originating in a specific geographical area and possessing a given quality, reputation or other characteristic that is essentially attributable to that geographical origin. Thus, the main function of a GI is to indicate a connection between that quality, characteristic or reputation of the good and its territory of origin.

Grant

A set of exclusive rights legally accorded to the applicant when a patent or utility model is granted or issued.

Gross domestic product (GDP)

The total unduplicated output of economic goods and services produced within a country as measured in monetary terms.

Hague international application

An application for the international registration of an industrial design filed under the WIPO-administered Hague System.

Hague international registration

An international registration issued via the Hague System, which facilitates the acquisition of industrial design rights in multiple jurisdictions. An application for international registration of an industrial design leads to its recording in the International Register and the publication of the registration in the *International Designs Bulletin*. If the registration is not refused by the IP office of a designated Hague member, the international registration will have the same effect as a registration made in that jurisdiction.

Hague member (Contracting Party)

A state or intergovernmental organization that is a member of the Hague System. Includes any state or intergovernmental organization which is party to the Geneva Act of 1999 and/or the Hague Act of 1960. Entitlement to file an international application under the Hague Agreement is limited to natural persons or legal entities having a real and effective industrial or commercial establishment, or a domicile, in at least one of the Contracting Parties to the Agreement, or being a national of one of those Contracting Parties or of a member state of an intergovernmental organization that is a Contracting Party. In addition – but only under the 1999 Act – an international application may be filed on the basis of habitual residence in the jurisdiction of a Contracting Party.

Hague route

An alternative to the Paris route (i.e., the direct national or regional route), the Hague route enables an application for international registration of industrial designs to be filed using the Hague System.

Hague System

The abbreviated form of the Hague System for the International Registration of Industrial Designs. This System comprises two international treaties: the Hague Act of 1960 and the Geneva Act of 1999. The Hague System makes it possible for an applicant to register up to 100 industrial designs in multiple jurisdictions by filing a single application with the International Bureau of WIPO. It simplifies multinational registration by reducing the requirement to file separate applications with each IP office. The System also simplifies the subsequent management of the industrial design, since it is possible to record changes or renew a registration through a single procedural step.

In force

Refers to IP rights that are currently valid or, in the case of trademarks, active. To remain in force, IP protection must be maintained.

Industrial design

Industrial designs are applied to a wide variety of industrial products and handicrafts. They refer to the ornamental or aesthetic aspects of a useful article, including compositions of lines or colors or any three-dimensional forms that give a special appearance to a product or handicraft. The holder of a registered industrial design has exclusive rights against unauthorized copying or imitation of the design by third parties. Industrial design registrations are valid for a limited period. The term of protection is usually 15 years in most jurisdictions. However, differences in legislation exist, notably in China (which provides for a 10-year term from the application date).

Intellectual property (IP)

Refers to creations of the mind: inventions, literary and artistic works, and symbols, names, images and designs used in commerce. IP is divided into two categories: industrial property – which includes patents, utility models, trademarks, industrial designs and geographical indications of source – and copyright, which includes literary and artistic works (such as novels, poems, plays, films), musical works, artistic works (such as drawings, paintings, photographs and sculptures) and architectural designs. Rights related to copyright include those of performing artists in their performances, those of producers of sound recordings in their recordings and those of broadcasters in their radio and television programs.

International Depository Authority (IDA)

A scientific institution – typically a culture collection – capable of storing microorganisms that has acquired the status of an International Depository Authority under the Budapest Treaty and provides for the receipt, acceptance and storage of microorganisms and the furnishing of samples thereof. Currently, 47 such authorities exist around the world.

International Patent Classification (IPC)

An internationally recognized patent classification system, the IPC has a hierarchical structure of language-independent symbols and is divided into sections, classes, sub-classes and groups. IPC symbols are assigned according to the technical features in patent applications. A patent application that relates to multiple technical features can be assigned several IPC symbols.

International Union for the Protection of New Varieties of Plants (UPOV)

An intergovernmental organization established by the International Convention for the Protection of New Varieties of Plants (the UPOV Convention), which was adopted on December 2, 1961. UPOV provides and promotes an effective system of plant variety protection with the aim of encouraging the development of new varieties of plants for the benefit of society.

Invention

A new solution to a technical problem. To qualify for patent protection, the invention must be novel, involve an inventive step and be industrially applicable, as judged by a person skilled in the art.

Lisbon System

The Lisbon System was established in 1958 to facilitate the international protection of appellations of origin through a single registration procedure. Registration with the WIPO International Bureau ensures protection in all Lisbon contracting parties, without need for renewal and as long as the appellation of origin remains protected in its contracting party of origin. However, the decision on whether to protect a newly registered appellation of origin at the national level remains the prerogative of each contracting party, and each Lisbon member can refuse protection based on any ground within one year of being notified of a new appellation of origin by the WIPO International Bureau. The Lisbon System is flexible with regard to the means by which countries may provide protection for the registered appellation of origin (e.g., *sui generis* systems, trademark laws or specific ad hoc decrees, as well as judicial and administrative decisions).

Locarno Classification

The abbreviated form of the International Classification for Industrial Designs under the Locarno Agreement, used for registering industrial designs. The Locarno Classification consists of 32 classes and their respective subclasses with explanatory notes plus an alphabetical list of the goods in which industrial designs are incorporated and an indication of the classes and subclasses into which they fall.

Madrid international application

An application for international registration under the Madrid System, which is a request for protection of a trademark in one or more Madrid members' jurisdictions. An international application must be based on a basic mark – prior application or registration of a mark in a Madrid member.

Madrid international registration

An application for international registration of a mark leads to its recording in the International Register and the publication of the international registration in the *WIPO Gazette of International Marks*. If the international registration is not refused protection by a designated Madrid member, it will have the same effect as a national or regional trademark registration made under the law applicable in that Madrid member's jurisdiction.

Madrid member (Contracting Party)

A state or intergovernmental organization – for example the European Union (EU) or the African Intellectual Property Organization (OAPI) – that is party to the Madrid Agreement and/or the Madrid Protocol.

Madrid route

The Madrid route (the Madrid System) is an alternative to the direct national or regional route (also called the Paris route).

Madrid System

An abbreviation describing two procedural treaties for the international registration of trademarks; namely, the Madrid Agreement for the International Registration of Marks and the Protocol relating to that Agreement. The Madrid System is administered by the International Bureau of WIPO.

Maintenance

An act by the applicant to keep an IP grant/registration valid (in force), primarily by paying the required fee to the IP office of the state or jurisdiction providing protection. That fee is also known as a “maintenance fee.” A trademark can be maintained indefinitely by paying renewal fees; however, patents, utility models and industrial designs can be maintained for only a limited number of years.

Microorganism deposit

The transmittal of a microorganism to an International Depositary Authority (IDA), which receives and accepts it, the storage of such a microorganism by the IDA, or both transmittal and storage.

National phase under the PCT

The phase that follows the international phase of the PCT procedure and that consists of the entry and processing of the international application in the individual countries or regions in which the applicant seeks protection for an invention.

National route

Applications for IP protection filed directly with the national office of, or acting for, the relevant state or jurisdiction (see also “Hague route,” “Madrid route” and “PCT route”). The national route is also called the “direct route” or “Paris route.”

Nice Classification

The abbreviated form of the International Classification of Goods and Services for the Purposes of Registering Marks, an international classification established under the Nice Agreement. The Nice Classification consists of 45 classes, which are divided into 34 classes for goods and 11 for services. (See “Class.”)

Non-resident

For statistical purposes, a “non-resident” application refers to an application filed with the IP office of, or acting for, a state or jurisdiction in which the first named applicant in the application is not domiciled. For example, an application filed with the Japan Patent Office (JPO) by an applicant residing in France is considered to be a non-resident application from the perspective of the JPO. Non-resident applications are sometimes referred to as foreign applications. A non-resident grant or registration is an IP right issued on the basis of a non-resident application.

Origin (country or region)

For statistical purposes, the origin of an application means the country or territory of residence of the first named applicant in the application. In some cases (notably in the U.S.), the country of origin is determined by the residence of the assignee rather than that of the applicant.

Paris Convention

The Paris Convention for the Protection of Industrial Property, signed on March 20, 1883, is one of the most important treaties, as it establishes general principles applicable to all IP rights. It establishes the “right of priority” that enables an IP applicant, when filing an application in countries other than the original country of filing, to claim priority of an earlier application filed up to 12 months previously for patents and utility models, and up to six months previously for trademarks and industrial designs.

Paris route

An alternative to the Hague, Madrid or PCT routes, the Paris route (also called the “direct route” or “national route”) enables individual IP applications to be filed directly with an IP office of a country/territory that is a signatory to the Paris Convention.

Patent

A set of exclusive rights granted by law to applicants for inventions that are new, non-obvious and commercially applicable. A patent is valid for a limited period of time (generally 20 years), during which patent holders can commercially exploit their inventions on an exclusive basis. In return, applicants are obliged to disclose their inventions to the public in a manner that enables others skilled in the art to replicate the invention. The patent system is designed to encourage innovation by providing innovators with time-limited exclusive legal rights, thus enabling them to appropriate the returns from their innovative activity.

Patent Cooperation Treaty (PCT)

An international treaty administered by WIPO, the PCT allows applicants to seek patent protection for an invention simultaneously in a large number of countries (PCT contracting states) by filing a single PCT international application. The granting of patents, which remains under the control of national or regional patent offices, is carried out in what is called the “national phase” or “regional phase.”

Patent family

Applicants often file patent applications in multiple jurisdictions, so some inventions are recorded more than once. To take this into account, WIPO has indicators related to patent families, defined as patent applications interlinked by one or more of: priority claim, Patent Cooperation Treaty national phase entry, continuation, continuation-in-part, internal priority and addition or division. WIPO’s patent family definition includes only those associated with patent applications for inventions and excludes patent families associated with utility model applications.

PCT application

A patent application filed through the WIPO-administered PCT, also known as an international application.

PCT-patent prosecution highway (PCT-PPH) pilots

A number of bilateral agreements signed between patent offices that enable applicants to request an accelerated examination procedure because of positive patentability findings made by the international searching and/or international preliminary examining authority, in the written opinion by an International Searching Authority, the written opinion of an International Preliminary Examining Authority or the international preliminary report on patentability.

PCT route

A patent application filed through the WIPO-administered PCT, also known as an international application.

PCT System

The PCT, an international treaty administered by WIPO, facilitates the acquisition of patent rights in a large number of jurisdictions. The PCT System simplifies the process of multiple national patent filings by reducing the requirement to file a separate application in each jurisdiction. However, the decision on whether to grant patent rights remains in the hands of national and regional patent offices, and patent rights remain limited to the jurisdiction of the patent-granting authority. The PCT application process starts with the international phase, during which an international search and, possibly, a preliminary examination are performed, and concludes with the national phase, during which a national or regional patent office decides on the patentability of an invention according to national law.

Pending patent application

In general, this refers to a patent application filed with a patent office for which no patent has yet been granted or refused, and for which the application has not been withdrawn. In jurisdictions where a request for examination is required to start the examination process, a pending application may refer to an application for which a request for examination has been received or one for which no patent has been granted or refused, and for which the application has not been withdrawn.

Plant Patent Act (PPA) of the U.S.

Under the law commonly known as the “Plant Patent Act,” whoever invents or discovers and asexually reproduces any distinct and new variety of plant, including cultivated sports, mutants, hybrids and newly found seedlings, other than a tuber-propagated plant or a plant found in an uncultivated state, may obtain a patent therefor.

Plant variety

According to the UPOV Convention, plant variety means a plant grouping within a single botanical taxon of the lowest known rank which, irrespective of whether the conditions for the granting of a breeder’s right are fully met, can be defined by the expression of the characteristics resulting from a given genotype or combination of genotypes, distinguished from any other plant grouping by the expression of at least one of the said characteristics and considered as a unit with regard to its suitability for being propagated unchanged.

Plant variety grant

Under the UPOV Convention, the breeder’s right is granted (title of protection is issued) only when the variety is new, distinct, uniform, stable and has a suitable denomination.

Plant Variety Protection Act (PVPA) of the U.S.

Under the PVPA, the U.S. protects all sexually reproduced plant varieties and tuber-propagated plant varieties, excluding fungi and bacteria.

Prior art

All information disclosed to the public about an invention, in any form, before a given date. Information on prior art can assist in determining whether the claimed invention is new and involves an inventive step (i.e., is non-obvious) for the purposes of international searches and international preliminary examination.

Priority date

The filing date of the application on the basis of which priority is claimed. (See “Paris Convention.”)

Publication date

The date on which an IP application is disclosed to the public. On that date, the subject matter of the application becomes prior art.

Regional application/grant (registration)

An application filed with or granted (registered) by an IP office having regional jurisdiction over more than one country. There are currently seven regional offices: the African Intellectual Property Organization (OAPI), the African Regional Intellectual Property Organization (ARIPO), the Benelux Office for Intellectual Property (BOIP), the Eurasian Patent Organization (EAPO), the European Patent Office (EPO), the European Union Intellectual Property Office (EUIPO) and the Patent Office of the Cooperation Council for the Arab States of the Gulf (GCC Patent Office).

Registered Community design

A registration issued by the EUIPO based on a single application filed directly with the office by an applicant seeking protection within the EU as a whole.

Registration

An exclusive set of rights legally accorded to the applicant when an industrial design or trademark is registered or issued. See “Industrial design” or “Trademark.” Registrations are issued to applicants to make use of and exploit their industrial designs or trademarks for a limited period of time and can, in some cases (particularly in the case of trademarks), be renewed indefinitely.

Renewal

The process by which the protection of an IP right is maintained (kept in force). This usually consists of paying renewal fees to an IP office at regular intervals. If renewal fees are not paid, the registration may lapse. See also “Maintenance.”

Resident

For statistical purposes, a resident application refers to an application filed with the IP office of, or acting for, the state or jurisdiction in which the first named applicant in the application has residence. For example, an application filed with the JPO by a resident of Japan is considered a resident application from the perspective of the JPO. Resident applications are sometimes referred to as “domestic applications.” A resident grant/registration is an IP right issued on the basis of a resident application.

Trademark

A sign used to distinguish the goods or services of one undertaking from those of others. A trademark may consist of words and combinations of words (for instance, names or slogans), logos, figures and images, letters, numbers, sounds, or, in rare instances, smells or moving images, or a combination thereof. The procedures for registering trademarks are governed by the legislation and procedures of national and regional IP offices and WIPO. Trademark rights are limited to the jurisdiction of the IP office that registers the trademark. Trademarks can be registered by filing an application at the relevant national or regional office(s), or by filing an international application through the Madrid System.

Utility model

A special form of patent right granted by a state or jurisdiction to an inventor or the inventor's assignee for a fixed period of time. The terms and conditions for granting a utility model are slightly different from those for normal patents (including a shorter term of protection and less stringent patentability requirements). The term can also describe what are known in certain countries as "petty patents," "short-term patents" or "innovation patents."

World Intellectual Property Organization (WIPO)

A United Nations specialized agency dedicated to the promotion of innovation and creativity for the economic, social and cultural development of all countries through a balanced and effective international IP system. WIPO was established in 1967 with a mandate to promote the protection of IP throughout the world through cooperation between states and in collaboration with other international organizations.

Abbreviations

AIA	America Invents Act
ARIPO	African Regional Intellectual Property Organization
BAILII	British and Irish Legal Information Institute
BOIP	Benelux Office for Intellectual Property
CAFC	Court of Appeals for the Federal Circuit
CNIPA	National Intellectual Property Administration of the People's Republic of China
CPVO	Community Plant Variety Office of the European Union
DPMA	Deutsche Patent- und Markenamt
EAPO	Eurasian Patent Organization
EPO	European Patent Office
EU	European Union
EUIPO	European Union Intellectual Property Office
GCC Patent Office	Patent Office of the Cooperation Council for the Arab States of the Gulf
GDP	gross domestic product
GI	geographical indication
IDA	International Depositary Authority
IP	intellectual property
IPA	International Publishers Association
IPC	International Patent Classification

Annexes

Annex A. Definitions for selected energy-related technology fields

Energy-related technologies	International patent classification (IPC) symbols
Solar energy technology	E04D 1/30, E04D 13/18, F24J 2/00, F24J 2/02, F24J 2/04, F24J 2/05, F24J 2/06, F24J 2/07, F24J 2/08, F24J 2/10, F24J 2/12, F24J 2/13, F24J 2/14, F24J 2/15, F24J 2/16, F24J 2/18, F24J 2/23, F24J 2/24, F24J 2/36, F24J 2/38, F24J 2/42, F24J 2/46, F03G 6/06, G02B 5/10, H01L 31/052, H01L 31/04, H01L 31/042, H01L 31/18, G02F 1/136, G05F 1/67, H01L 25/00, H01L 31/00, H01L 31/048, H01L 33/00, H02J 7/35, H02N 6/00
Fuel cell technology	H01M 4/00, H01M 4/86, H01M 4/88, H01M 4/90, H01M 8/00, H01M 8/02, H01M 8/04, H01M 8/06, H01M 8/08, H01M 8/10, H01M 8/12, H01M 8/14, H01M 8/16, H01M 8/18, H01M 8/20, H01M 8/22, H01M 8/24
Wind energy	F03D 1/00, F03D 3/00, F03D 5/00, F03D 7/00, F03D 9/00, F03D 11/00, B60L 8/00
Geothermal energy	F24J 3/08, F03G 4/00, F03G 7/05

Note: For definitions of IPC symbols, see www.wipo.int/classifications/ipc. The correspondence between IPC symbols and technology fields is not always clear-cut, and so it is difficult to capture all patents in a specific technology field. Nonetheless, the IPC-based definitions of the four technologies presented above are likely to capture the vast majority of related patents.

Annex B. Composition of industry sectors by Nice goods and services classes

Industry sector	Abbreviation (where applicable)	Nice classes
Agricultural products and services	Agriculture	29, 30, 31, 32, 33, 43
Management, communications, real estate and financial services	Business services	35, 36
Chemicals	..	1, 2, 4
Textiles – clothing and accessories	Clothing	14, 18, 22, 23, 24, 25, 26, 27, 34
Construction, infrastructure	Construction	6, 17, 19, 37, 40
Pharmaceuticals, health, cosmetics	Health	3, 5, 10, 44
Household equipment	..	8, 11, 20, 21
Leisure, education, training	Leisure & Education	13, 15, 16, 28, 41
Scientific research, information and communication technology	Research & Technology	9, 38, 42, 45
Transportation and logistics	Transportation	7, 12, 39

Source: Edital®.

Annex C. Industry sectors by Locarno classes

Sector	Locarno classes
Advertising	20, 32
Agricultural products and food preparation	1, 27, 31
Construction	23, 25, 29
Electricity and lighting	13, 26
Furniture and household goods	6, 7, 30
Health, pharma and cosmetics	24, 28
ICT and audiovisual	14, 16, 18
Leisure and education	17, 19, 21, 22
Packaging	9
Textiles and accessories	2, 3, 5, 11
Tools and machines	4, 8, 10, 15
Transport	12

The *World Intellectual Property Indicators* is the annual survey of intellectual property (IP) activity around the world from WIPO, the United Nations specialized agency for innovation and IP.

This authoritative report analyzes IP activity across patents, utility models, trademarks, industrial designs, microorganisms, plant variety protection, and geographical indications, drawing on filing, registration and in-force statistics from national and regional IP offices, as well as WIPO's international filing and registration systems. The report also includes statistics on the creative economy for the first time, making it even more comprehensive.

The special theme of this year's edition explores how one might statistically capture patent litigation activity and presents selected statistics for the United Kingdom and the United States of America.
