# Foreword

With the world economy on a firmer footing than in recent years, global intellectual property (IP) filings have reached new highs. Global patent filings grew by 8.3% and global trademark filing activity by 13.5% – making for seven years of straight increases. Following an 8% decline in 2014 and 1% growth in 2015, industrial design filing activity rebounded strongly in 2016 with 8.3% growth.

As seen in previous years, China remained the main driver of global growth in filings. From already high levels, patent applications in China increased by 21.5%, as did filing activity for trademarks (+30.8%) and industrial designs (+14.3%). The United States of America also saw increases in filing activity for patents, trademarks and industrial designs, which grew by 2.7%, 5.5% and 12.1%, respectively. Other notable trends include large increases in trademark filing activity in Japan (+30.8%), the Russian Federation (+14.8%) and India (+8.3%), and rapid growth in industrial design filing activity in the Russian Federation (+9.4%) and at the European Union Intellectual Property Office (EUIPO; +6.5%). For the first time, however, the Republic of Korea saw declines in filing activity for all three intellectual property (IP) rights – patents (-2.3%), trademarks (-1.7%) and industrial designs (-4.6%).

The 2017 edition of WIPO's *World Intellectual Property Indicators* documents these and many other developments that shaped the global IP system in 2016. This year's special theme presents new statistics on certain dimensions of the operational performance of IP offices, including the size of their examiner workforce, application pendency times and patent examination

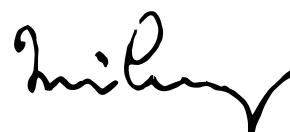

outcomes. We are mindful that differences in IP filing procedures limit direct comparability of operational statistics across offices, but believe nonetheless that they can usefully inform decision-makers, especially when monitoring trends over time.

For the first time ever, this year's edition also publishes statistics on geographical indications (GIs). Noting the absence of statistical information on this form of IP, we initiated a new statistical survey and received responses from 54 national and regional authorities responsible for administering GIs. Correctly capturing the number of GIs in force in different jurisdictions is challenging due to the multiple ways in which GIs can be protected. We recognize that the statistics collected are incomplete but view them as a first step toward establishing a more complete picture of GI activity worldwide in the future.

Readers wishing to go beyond the statistics presented in this report can use the statistical tools on WIPO's website ([www.wipo.int/ipstats](http://www.wipo.int/ipstats)), notably the IP Statistics Data Center and the Statistical Country Profiles.

Finally, I would like to thank our Member States as well as national and regional IP authorities for sharing their annual statistics with WIPO. Their invaluable cooperation makes the *World Intellectual Property Indicators* possible.

Francis GURRY  
Director General

# Acknowledgements

*World Intellectual Property Indicators 2017* was prepared under the direction of Francis Gurry (Director General) and supervised by Carsten Fink (Chief Economist). The report was prepared by a team led by Mosahid Khan and comprising Kyle Bergquist, Ryan Lamb, Bruno Le Feuvre, Julio Raffo, Kritee Sharrma and Hao Zhou, all from the Economics and Statistics Division. The geographical indications section was prepared by Matteo Gragnani and benefited greatly from the inputs contributed by David Muls and Alexandra Grazioli, all from the Brands and Designs Sector. Peter Button of the

International Union for the Protection of New Varieties of Plants (UPOV) provided comments and suggestions for the plant varieties section.

Samiah Do Carmo Figueiredo and Caterina Valles Galmes provided administrative support. Gratitude is also due to editorial and design colleagues in the Communications Division for leading the production of the report, especially Toby Boyd for his editing work. Thanks go to staff in the Printing Plant for their services.

# Special section

## Patent office operations: application processing times, examination capacity and examination outcomes

### Introduction

Patent offices examine applications and decide whether or not to grant patent rights. Examination processes differ across offices. For example, some offices such as South Africa conduct a purely formal examination of the application, whereas others such as Japan undertake both formal and substantial examination.

The substantive examination process usually consists of determining whether the claimed innovation is novel, non-obvious and industrially applicable. This may involve numerous interactions between applicants and examiners, and can be a lengthy process. For example, the patent grant procedure at the European Patent Office (EPO) takes three to five years from the date on which the application is filed. Annex S1 depicts the major phases of granting procedures at the five offices that receive the largest numbers of applications.

Procedures across offices may differ as regards:

- the patentability of subject matter;
- whether a request for examination must be made, and if so the time period within which such requests must be made;
- fee structure;
- whether and how an applicant may request accelerated examination;
- bilateral/multilateral work-sharing agreements such as a patent prosecution highway;
- the applicant-examiner communication process;
- management of workload, for example whether the prior art search is outsourced;
- the office's budget-setting procedure;
- the opposition system (e.g., pre-grant, post-grant, etc.);
- the training and experience of patent examiners, and incentives offered to them; and
- whether it may be possible to continue with an application after its initial rejection by filing continuation-in-parts, divisional application and so on.

Every effort has been made to compile procedural data based on common definitions and concepts, but the differences in procedures make it extremely difficult to fully harmonize such data. For instance, "rejection" is not recorded as a final decision in Canada. Applicants are informed what they must do/answer in order for their application to be considered, and if an applicant cannot provide the required information, they are regarded as having abandoned the application. A similar situation exists in Australia. To take another example, rejection of an application has a different meaning at offices, such as that of South Africa, which do not perform a substantive examination than at offices which do. At many offices, filing a national application does not imply a request for examination. For example, in China and Japan a request for examination can be made up to three years after the date the application was filed. In the U.S., filing an application implies an immediate request for examination.

This special section reports statistics on patent office examination capacity, application processing time and examination outcome. To shed light on these issues, WIPO has compiled patent procedural data from a number of patent offices (annex S2). This is the first time WIPO has collected such procedural data. As explained, it is challenging to compile comparable data and so one should exercise caution when making comparisons between offices. To address this data limitation, it is more meaningful to focus on trends at a given office.

A number of offices recorded large increases in patent applications received over the past two decades, with a threefold increase in patent applications filed worldwide between 1995 and 2016. The Republic of Korea and the U.S. each saw applications multiply by a factor of 2.7 (figure S1). The rapid growth in filings has led to an increased number of pending applications and considerable backlogs (see box for the definition of potentially pending applications). In 2016, the number of potentially pending applications stood at 1.1 million in the U.S., around 847,000 in Japan and about 668,000 at the EPO. Offices of middle-income countries Brazil and India also held large stocks of potentially pending applications (figure S2).

The growing number of applications has put pressure on offices to process applications in a timely manner while reducing backlogs. This has generated

much discussion among academics, patent offices, policymakers and the press about pendency time, backlogs and the quality of issued patents.<sup>1</sup> Offices face the challenge of providing timely examination of patents while maintaining high examination quality.

***How large has the increase in patent office workloads been?***

The number of applications filed worldwide reached the 1 million mark in 1995, and has trended upward since then. In 2011, applications

exceeded 2 million. It then took only five years to reach 3 million. In 2016, more than 3.1 million applications were filed.

Applications filed in China increased from 18,700 in 1995 to 1.3 million in 2016, amounting to average yearly growth of 23%. Brazil, India and the Islamic Republic of Iran have also seen marked increases in applications filed in their countries over the past two decades (figure S1). The EPO, the Republic of Korea and the U.S. each saw average annual growth of around 5% over the same period.

**Figure S1**  
**Evolution of the number of patent applications filed at selected offices**

Source: WIPO Statistics Database, September 2017.

In order to manage their incoming workload, patent offices need to adapt their processing capacity, particularly their examination capacity, according to the number of patent applications received. Strong growth in patent applications has the potential to increase the number of pending applications, resulting in backlogs, as hiring and training additional examiners takes time. While a certain level of pending applications is needed to fully occupy examiners, excessive backlogs can lead to longer pendency times.

Figure S2 shows the growth of potentially pending applications at the top 10 patent offices for which data are available. These top 10 offices were

selected based on their total number of potentially pending applications in 2016. Potentially pending application data for China – the office that received by far the largest volume of applications – are not available. Figure S2 shows that all offices, except those of Canada and Japan, had substantially more potentially pending applications in 2016 than in 2005. The number of potentially pending applications in Australia and Brazil more than doubled between 2005 and 2016. India's volume of potentially pending applications in 2016 was 2.4 times higher than the level recorded in 2010. The decline in Japan was partly due to a substantial decrease in the number of patent applications filed.

**Figure S2**  
**Evolution of potentially pending applications**

Note: Data for Brazil includes both patent and utility models applications.  
Source: WIPO Statistics Database, September 2017.

### Potentially pending applications

Potentially pending applications include all patent applications, at any stage in the process, awaiting a final decision by a patent office, including those applications for which applicants have not filed a request for examination (where applicable). The concept of “potentially” pending applications is used rather than pending applications because, in many offices, the request for examination is filed at a later date than the application. Although the application is already at the office, it cannot start the examination process until the request for examination is filed. It is preferable to use the concept “potentially” pending applications to cover such cases.

To deal with the growing number of incoming applications and pending applications, offices need to have adequate examination capacity.<sup>2</sup> Figure S3 presents the trend in patent filings and the number of patent examiners at selected offices. It shows that the evolution of examination capacity – measured by number of examiners – at various

offices generally has kept pace with the evolution of patent applications. For example, at the EPO, the Republic of Korea and the Russian Federation, patent applications and the number of examiners have grown at a similar rate, while at other reported offices the number of examiners has increased faster than patent filings.

### Patent examiners

Data on the number of patent examiners consider those working full time and do not take into account other possible workforces provided by outsourcing companies and freelancers. However, examination work undertaken by affiliated institutions is included. At some offices, such as those of Japan and the Republic of Korea, patent examiners also process utility model applications, while in the U.S. patent examiners also deal with plant variety applications. These offices cannot provide breakdowns between patent examination and utility model/plant variety examination. The number of patent examiners at the office of Australia includes hearing staff, who account for a small proportion of the total staff.

Source: WIPO Statistics Database, September 2017

Figure S4 shows the average number of patent filings per examiner for selected offices.<sup>3</sup> Although the examination phase of an application usually occurs some-time after it has been filed, the average number of filings per examiner gives an indication of the examination capacity of offices relative to their numbers of incoming patent applications.

Thirteen of these 14 offices had fewer applications per examiner in 2016 than in 2005. For example, in the U.K. the average number of applications per examiner declined from 139 in 2005 to 63 in 2016. However, Japan had the largest drop in the number of applications per examiner, due mainly to a decrease in the number of patent applications filed in Japan. There was no change in the applications-per-examiner ratios

for Denmark and the EPO. The Republic of Korea saw a gradual increase in applications per examiner.

Japan and the Republic of Korea had the highest average applications per examiner among the selected offices. However, it is difficult to draw any conclusions from this, as the content of applications filed in Japan, the Republic of Korea and other offices might differ. For example, the average number of claims per application, the average number of pages per application and the complexity of application can vary across offices. In addition, an office's capacity to handle incoming applications depends on factors other than the number of examiners, such as outsourcing prior art searches, cooperation among offices and so on.

**Figure S4**  
Average number of filings per examiner for selected patent offices

Note: Offices were selected based on the availability of patent examiner data. Patent examiner data for India refer to head count rather than full-time equivalents.

Source: WIPO Statistics Database, September 2017.

### *Pendency time*

Measuring the time between the request for examination and the first office action, and between the request for examination and the final decision, provides an indication of the application processing delay. A long delay in processing applications at any given office does not necessarily imply that the office is processing applications too slowly. Among other factors, applicants can slow down the processing of applications at offices. For example, at the EPO applicants can amend their applications when they are undergoing search and examination. Similarly, at the United States Patent and Trademark Office (USPTO) applicants have many ways to delay prosecution from first action to final disposition. Paying for extensions of time to reply and filing requests for continued examination are the most often-used methods.

Figure S5 shows the average number of months that elapsed from the request for examination – or, where appropriate, patent filing – to the first action and the final decision for selected offices in 2016.

Pendency time for final decision was shortest in the Islamic Republic of Iran (9 months), Spain (11.2), Ukraine (13.5), Japan (15) and the Republic of Korea (16.2). China (22), the U.S. (22.6) and the EPO (23.3) all took roughly the same time on average to reach final decisions. The average time for final decision exceeded 50 months in Brazil (95.4), India (84), the Czech Republic (53) and Viet Nam (51.5).

Average pendency time for first office action was shortest at the offices of New Zealand (1.3 months), Mexico (3) and the Islamic Republic of Iran (4). In contrast, Brazil (84 months) and India (72 months) had the longest pendency times for first action.

Average pendency times for final office decision were longest in Brazil and India. However, the period between first office action and final decision at those offices was relatively short – 11.4 months in Brazil and 12 months in India. The average time between first office action and final decision was particularly short in Ukraine (3.1 months), the Islamic Republic of Iran (5) and Spain (5.4).

## **Pendency time**

Pendency time for the first office action is calculated as the average time (months) from request for examination to the first office action. Where applicants are not required to request examination, it is calculated from the filing date to the date of first office action.

Pendency time for the final office decision is calculated as the average time (months) from request for examination to final decision. Where applicants are not required to request examination, it is calculated from the filing date to the date of examination decision.

Calculations of pendency time by offices can differ due to marked differences in their procedures. Therefore, caution should be exercised when comparing data across offices. Ideally, one should focus on the evolution of pendency time at a specific office.

**Figure S5**  
**Average pendency times for first office action and final decision at selected offices, 2016**

■ FIRST OFFICE ACTION ■ FINAL DECISION

Source: WIPO Statistics Database, September 2017.

Figure S6 presents the changes in pendency times between 2011 and 2016 for selected offices, chosen based on data availability. On both measures, first office action and final decision, pendency time improved for all reported offices except China, where pendency time for the first office action increased marginally.

Japan saw the sharpest reduction in first office action pendency time, from 25.9 months in 2011 to 9.5 months in 2016. Canada and the U.S. also shortened their first office action pendency times considerably over the same period.

All the selected offices saw their final decision pendency times decrease, with New Zealand reporting the biggest fall. Canada, Japan and the U.S. also saw vast improvements over the same period.

### Examination outcomes

The number of patents granted worldwide has increased rapidly during the past few years. In 2016, an estimated 1.35 million patents were granted worldwide, up 8.9% on 2015. The increase in the number of granted patents has generated some discussion in academic circles – mostly in the U.S. – on whether too many patents are being granted by offices.<sup>4</sup> Analyzing

patent grant rates over time would shed some light on this topic. However, calculating grant rates is a challenge because offices did not provide information on applications that are withdrawn, abandoned or rejected before publication. In addition, processing applications takes time – between three and five years on average, and even longer for filings in some specific fields of technology.<sup>5</sup> Furthermore, rejected patents can enter the system via continuation-in-parts or divisional application, making it hard to define the numerator and denominator precisely.

An alternative to the grant rate could be to focus on the outcome of the total number of applications processed by offices within a given year. The examination of a patent usually results in it being either granted, rejected, withdrawn or abandoned. Some offices, such as those of Australia and Canada, rarely reject patents. In the case of the office of Australia, only the hearing staff can reject applications. If the patent examiner has not granted the application by the end of the examination phase, the applicant can decide to proceed further, for example through a continuation-in-part. The office of Canada does not reject applications; a large proportion of abandoned files have a suspended status and, as a result, are still considered to be at the examination stage.

**Figure S6**  
Average pendency times for first office action and final decision at selected offices, 2011 and 2016

Note: Offices were selected based on 2011 and 2016 data availability.  
Source: WIPO Statistics Database, September 2017.

Figure S7 shows the distribution of examination outcomes for selected offices. The shares of applications granted should not be interpreted as grant rates, as they are based on the examination date rather than the date the application was filed. The number of grants in a given year relates to applications filed in previous years.

More than three-quarters of applications examined in 2016 resulted in patents being granted at the offices of Indonesia (81%), Spain (81%), the Russian Federation (79%) and Japan (75%). Among the 20 selected offices, seven granted patents for fewer than half of applications processed in 2016. The offices of Thailand (10%), Brazil (19%) and India (28%) had low proportions of patents granted for applications processed, primarily due to high proportions of withdrawn or abandoned applications. Around three-fifths of all applications processed by the office of the

Republic of Korea resulted in patents, while for the U.S. the ratio was just under a third. Data for China and the EPO are not available.

The shares of rejected applications were the highest in the U.S. (52%), Saudi Arabia (49%) and the Republic of Korea (38%). Several other offices had relatively high shares of rejected applications, including those of Colombia (34%), Germany (23%) and the Japan Patent Office (JPO); (23%). The share of processed applications that were rejected was low in Australia, Indonesia, Mexico and Norway. This can be explained in part by the high share of withdrawn/abandoned applications, where applicants decided to withdraw applications before they could be rejected. However, if an examiner does not grant a patent for an application, in many offices it is possible for applicants to amend their application and continue with the examination process (for example, through a continuation-in-part, divisional application, etc.).

**Figure S7**  
**Distribution of patent examination outcomes for selected offices, 2016**

Source: WIPO Statistics Database, September 2017.

Procedural differences limit cross-country comparison. Analyzing the distribution of examination outcomes at a given office over time is more meaningful. Figure S8 shows the distribution of examination outcomes for two intervals (2010-12 and 2014-16). Data going back to 2010 are available for only a small number of offices, so it is not possible to analyze longer time periods.

The share of the total number of processed applications granted increased in seven of the eight

offices presented between 2010-12 and 2014-16. In Japan, the grant ratio increased from 59% to 71% (12 percentage points), and increased by 9 percentage points in Canada. Brazil saw an increase of 5.6 percentage points. Australia and the U.S. both saw an increase of around 4 percentage points, while for Germany and the Russian Federation the increase was only 1.7 and 1.2 percentage points respectively. The Republic of Korea is the only office where the grant ratio declined by 1.9 percentage points from 65% in 2010-12 to 63.1% in 2014-16.

## Conclusions

The workload of patent offices as measured by the number of incoming patent applications has increased over time, but so has their examination capacity to process those applications. As documented in this section, the available data show there has been no significant increase in application-to-examiner ratios; in fact, for a number of offices, growth in numbers of examiners has outstripped the increase in applications.

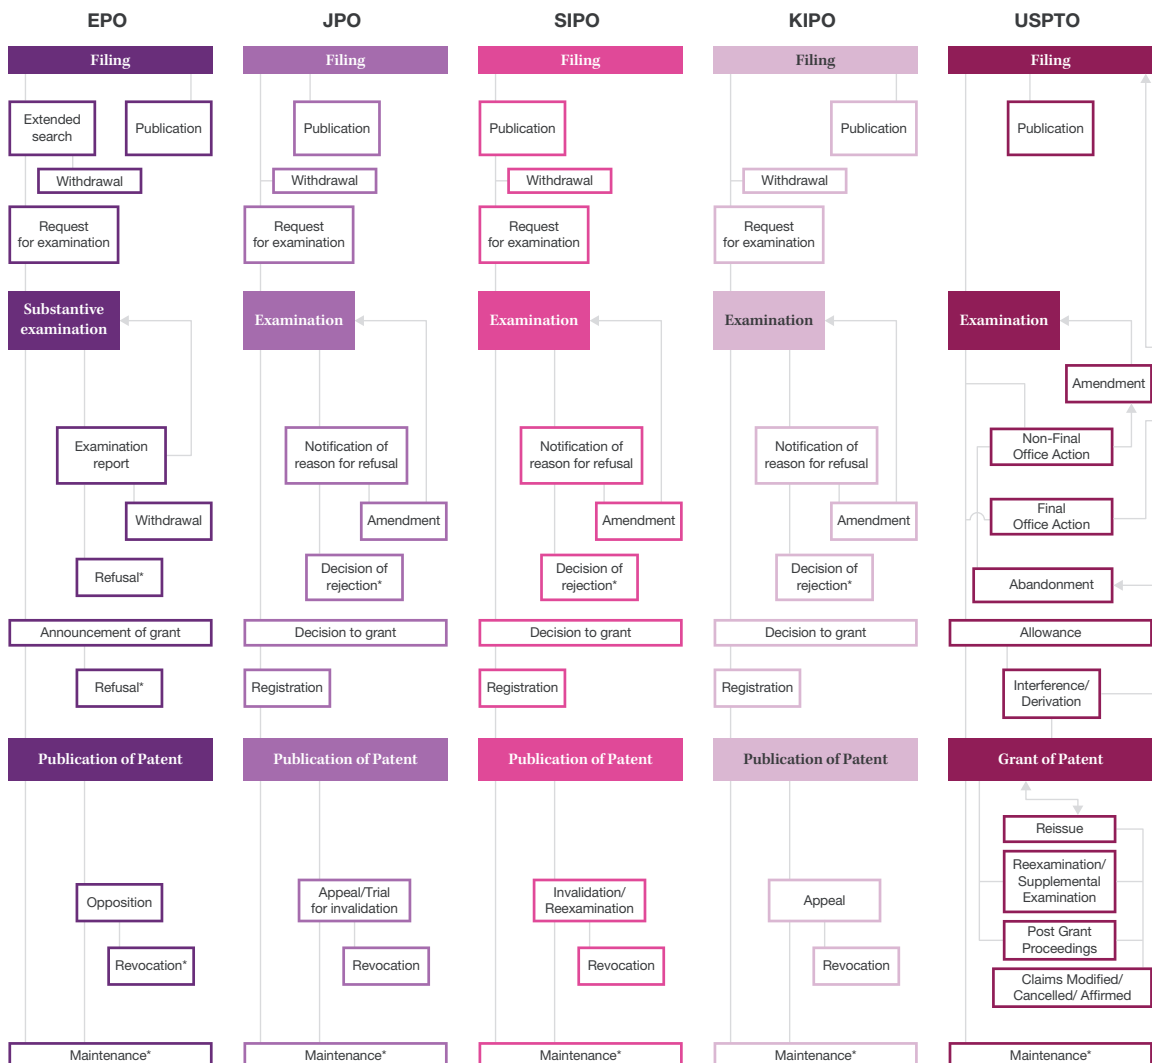

Operational data on patent offices can contribute to evidence-based decision-making. However, procedures vary across offices and comparison should only be made among offices with similar procedures or, preferably, for a particular office over time.

WIPO will continue to collect these data to enable better monitoring of trends over time, and will expand the range of statistical indicators on operational dimensions.

WIPO is grateful to all offices that have shared their data. We encourage offices unable to share such data at present to make efforts to share them in the future.

## Annex S1

### Patent procedures at the world's five largest IP offices (the IP5)

Source: IP5 Statistics Report, 2015 edition.

## Annex S2

### Procedural data for 2016

WIPO added a new questionnaire to its annual IP statistics survey to compile the following data from offices across the world:

A. Number of patent examination decisions in the given year broken down by applications which are: granted, rejected, and withdrawn or abandoned.

B. Number of patent examiners (full-time equivalent, FTE), including persons conducting patent examination in affiliated institutions.

C. Average years of experience of examiners (number of years from recruitment including training period).

D. Average time (months) from the request for examination to the first office action (where applicants are not required to request examination, from the filing date to the date of first office action).

E. Average time (months) from the request for examination to the final decision (where applicants are not required to request examination, from the filing date to the date of examination decision).

The following offices provided data for 2016. In addition, several offices provided data going back to 2010.

**Table S1**

Note: Patent examiner data for India refer to head count rather than full-time equivalents.

Grant data might slightly differ to grant data reported elsewhere in this report due to different dates of extraction.

Source: WIPO Statistics Database, September 2017.

## Country notes

### Australia

The number of examiners includes hearing staff.

### Canada

In Canada, the abandon status is a suspension status only. It means that a fee or a response to a report from the client is outstanding and the deadline to pay the fee or respond to a letter has passed. A large proportion of abandoned files are caused by an agent/client not answering an examiner's report in time. A large proportion of abandoned files are actually still at the examination stage. Other than an allowance/grant of a patent, the patent office does not issue a final decision as "rejection." Applicants are informed what they must do/answer in order for their application to be allowed. If the applicant cannot answer this question, they are regarded as having abandoned the application.

### European Patent Office

The first office action data include all kinds of searches done at the EPO, including searches on behalf of national offices. Final decision numbers are calculated as the time to decision to grant for patents for which the decision to grant was made in the given year. This definition was adopted in the 2016, which is why data are only available for 2015 and 2016.

### Japan

The number of examiners includes both patent and utility model examiners. Examiners are responsible for processing both patent and utility model applications.

### Republic of Korea

The number of examiners includes both patent and utility model examiners. Examiners are responsible for processing both patent and utility model applications.

### U.S.

The rejected applications are applications with a non-final or final rejection that was neither patented nor abandoned. Data on the number of examiners and the time for patent examination include both patent and plant variety applications. However, the number of plant variety applications is low compared with patents – around 1,100 plant applications per year. So the number of examiners for the plant variety area is very small compared to the total number of examiners, and the impact on the time for patent examination is insignificant given the predominance of patent applications.

# Patents

## Highlights

*More than 3 million patent applications were filed worldwide in 2016 – a record number*

For the first time, more than 3 million patent applications were filed worldwide in a single year, up 8.3% from 2015 (figure 1). Driving such strong growth was an exceptional number of filings in China, which received about 236,600 or 98% of the additional filings. The next largest contributor was the United States of America (U.S.) with around 16,200 additional filings. Following a modest increase of 4.5% in 2014, the growth rate picked up in both 2015 (+7.7%) and 2016 (+8.3%), aligning with the annual growth rates of between 8% and 9% observed between 2011 and 2013. But when patent applications in China are excluded, applications filed in the rest of the world grew by only 0.2% in 2016.

*China received more applications than the combined total for the EPO, Japan, the Republic of Korea and the U.S.*

The State Intellectual Property Office of the People’s Republic of China (SIPO) received 1.3 million patent applications in 2016 – more than the combined total for the United States Patent and Trademark Office (USPTO; 605,571), the Japan Patent Office (JPO; 318,381), the Korean Intellectual Property Office (KIPO; 208,830) and the European Patent Office (EPO; 159,358). Together, these top five offices accounted for 84% of the world total in 2016, which is nine percentage points higher than their combined share 10 years earlier. The list of top 10 offices in 2016 is almost the same as for 2015, except that Brazil was replaced by Australia as the tenth highest ranked office in 2016 (figure 2). Brazil moved down one position as a result of a 7.3% annual decline in filings.

**Figure 1**  
**Patent applications worldwide**

**Figure 2**  
**Patent applications at the top 10 offices, 2016**

■ RESIDENT ■ NON-RESIDENT

Source: Standard figure A8.

Of the top 20 patent offices, 12 were located in high-income countries, six in upper middle-income countries and two in lower middle-income countries. In terms of geographical distribution, eight offices were located in Asia, six in Europe, two in North America, two in Latin America and the Caribbean (LAC), and one each in Africa and Oceania.

Eight of the top 20 offices received more applications in 2016 than in 2015, while 12 received fewer. South Africa (+29.5%), China (+21.5%) and China Hong Kong (SAR; +15.4%) all exhibited double-digit growth. The strong growth in filings in China Hong Kong (SAR) and South Africa followed small declines at those offices the previous year, while China has had double-digit growth each year since 2010. The increases in applications filed in China and South Africa were both driven mainly by growth in resident applications, whereas growth in China Hong Kong (SAR) came primarily from an increase in non-resident applications. Another office that showed notable growth in 2016 was that of the Islamic Republic of Iran (+9.5%).

Of the 12 offices among the top 20 that received fewer applications in 2016 than in 2015, the Russian Federation (-8.6%), Brazil (-7.3%), Indonesia (-6.7%), and Canada (-6%) reported the most substantial declines. Applications in Brazil fell for a third consecutive year. Following strong growth in applications received in 2015, Canada, Indonesia and the Russian

Federation all saw decreases in 2016. A decline in resident applications was the primary reason for the decrease in total applications for the Russian Federation, whereas a decline in non-resident applications was the main driver for Canada and Brazil.

Among the top five offices, the JPO (-0.1%) saw a small drop in applications, continuing a trend that started in 2006 and mainly reflects a persistent fall in resident applications. The number of resident applications filed at the JPO has declined from around 347,000 in 2006 to around 260,200 in 2016. Following two consecutive years of growth, the EPO's filings declined by 0.4% in 2016 due to a drop in non-resident applications. KIPO has enjoyed solid growth in applications received each year since 2010, but filings there declined by 2.4% in 2016 primarily due to a decline in resident applications. SIPO, however, continues to experience very strong growth in applications received and retains top spot. The USPTO has seen seven consecutive years of growth.

Among offices of low- and middle-income countries, Morocco (+27.6%), the Republic of Moldova (+25%), Sri Lanka (+19.1%) and Turkey (+17.2%) recorded particularly rapid growth in 2016. Growth in resident applications was the main driver of total growth in the Republic of Moldova, Sri Lanka and Turkey, while non-resident applications were the main driver in

Morocco. The three regional offices – the African Intellectual Property Organization (OAPI), the African Regional Intellectual Property Organization (ARIPO) and the Eurasian Patent Organization (EAPO) – have seen applications fall for two successive years, mainly due to a drop in resident applications. At most offices of low- and middle-income countries, the bulk of applications is filed by non-residents. As a result, overall increases or decreases in applications received by these offices are determined mainly by the filing behavior of non-resident applicants.

### *Asia became the first region to receive 2 million applications in a single year*

Offices located in Asia received just over 2 million applications in 2016, representing a 13% increase on 2015. Asia's share of all applications filed worldwide increased from 49.7% in 2006 to 64.6% in 2016, primarily driven by strong growth in filings in China (figure 3), which accounted for around two-thirds of all applications filed in the region. Excluding China, the share of the rest of Asia in the world total actually decreased from around 37.9% to 21.8% over the same period, mainly due to a decrease in applications filed in Japan.

Offices in North America accounted for one-fifth of the 2016 world total, while those in Europe accounted

for just over one-tenth. The combined share for Africa, Latin America and the Caribbean (LAC) and Oceania was 3.6%. The shares of all world regions except Asia have gradually declined over the past decade due to the rapid growth in applications filed in China.

Offices of high-income countries received almost half of all applications filed worldwide in 2016 – considerably lower than their 78.3% share in 2006 – while the share for offices of upper middle-income countries rose from 18.3% in 2006 to 47.6% in 2016 (figure 4). This shift in distribution of applications toward the upper middle-income group is largely explained by the strong growth in filings in China and the decline in Japan. Applications filed in China increased from just over 210,000 in 2006 to around 1.3 million in 2016, whereas those filed in Japan decreased from around 408,000 to around 318,000 over the same period. China accounted for 90% of the upper middle-income group total in 2016; excluding China, the remaining upper middle-income countries received just 4.8% of total worldwide filings.

The combined share of the low- and lower middle-income groups was 2.8% in 2016, which is slightly below the 3.4% observed in 2006. However, the number of applications received by offices of these two income groups rose from 61,200 to 86,000 during the same period.

### Patent filings since 1883

From 1883 to 1963, the patent office of the U.S. was the leading office for world filings. Application numbers in Japan and the U.S. were stable until the early 1970s, when Japan began to see rapid growth, a pattern also observed for the U.S. from the 1980s onward. Among the top five offices, Japan surpassed the U.S. in 1968 and maintained the top position until 2005. Since the early 2000s, however, the number of applications filed in Japan has trended downward. Both the EPO and the Republic of Korea have seen increases each year since the early 1980s, as has China since 1995. China surpassed the EPO and the Republic of Korea in 2005, Japan in 2010 and the U.S. in 2011 – and it now receives the largest number of applications worldwide. There has been a gradual upward trend in the combined share of the top five offices in the world total – from 74% in 2006 to 84% in 2016.

### Trend in patent applications for the top five offices

Note: The IP office of the Soviet Union, not represented in this figure, was the leading office in the world in terms of filings from 1964 to 1969. Like Japan and the U.S., the office of the Soviet Union saw stable application numbers until the early 1960s, after which it recorded rapid growth in applications filed.

Source: Standard figure A7.

## Equivalent application class count

Applications at regional intellectual property (IP) offices are equivalent to multiple applications in the countries that are members of the organizations establishing those offices. In particular, to calculate the number of equivalent applications for the African Intellectual Property Organization (OAPI), the Eurasian Patent Organization (EAPO) and the Patent Office of the Cooperation Council for the Arab States of the Gulf (GCC Patent Office), each application is multiplied by the corresponding number of member states. For African Regional Intellectual Property Organization (ARIPO) and the European Patent Office (EPO) data, each application is counted as one application abroad if the applicant does not reside in a member state or as one resident application and one application abroad if the applicant resides in a member state. The equivalent application concept is used for reporting data by origin.

### *Residents of the U.S. filed more than four times as many patent applications abroad as Chinese residents*

Applications received by offices from resident and non-resident applicants are referred to as office data, whereas applications filed by applicants at a national/regional office (resident applications) or at foreign offices (applications abroad) are referred to as origin data. Here, patent statistics based on the origin of residence of the first named applicant are reported in order to complement the picture of patent activity worldwide.

Applicants from China filed around 1.26 million equivalent patent applications in 2016 – more than the combined total for applicants from the U.S. (520,877), Japan (453,640) and the Republic of Korea (233,625)

(map 1). China has been the largest origin of patent applications since 2012, when it surpassed Japan. However, it should be noted that around 96% of all applications from China are filed in China and only 4% filed abroad. In contrast, filings abroad constitute around 43% of total applications from Japan and the U.S.

Twelve of the top 20 origins are located in Europe. Their combined total equivalent patent applications (523,605) is slightly higher than that from U.S.-based applicants. All top 20 origins, with the exception of China, India, the Islamic Republic of Iran and the Russian Federation, are high-income countries.

Among the top 20 origins, China (+24.4%), India (+7.7%), Belgium (+4.7%) and Israel (+4.3%) recorded the fastest growth in 2016. Almost all the growth in

## Map 1 Equivalent patent applications by origin, 2016

Source: Standard map A17.

filings from applicants from China was driven by increases in resident filings – of 246,700 additional filings by Chinese applicants, 236,700 were filed in China and only 10,000 abroad. For both India and Israel, growth in applications abroad (mainly in the U.S.) was the main source of overall growth.

A number of origins not among the top 20, such as South Africa (+96.9%), the United Arab Emirates (+38.8%), Colombia (+34.6%), Saudi Arabia (+33.8%) and Argentina (+28.5%), recorded double-digit growth. The overall growth in Argentina, Colombia, Saudi Arabia and South Africa was due to increases in resident applications, while growth in equivalent applications abroad drove overall growth in the United Arab Emirates.

Filing abroad reflects the globalization of intellectual property (IP) protection and a desire to commercialize technology in foreign markets. The costs of filing abroad can be substantial, so the patents for which applicants seek international protection are likely to confer higher values. Among the top 20 origins, applications filed abroad made up a large share of the totals for Canada, Israel and Switzerland. However, in absolute numbers, the U.S. had the most with 215,918, followed by Japan (191,819) and Germany (75,378). Germany saw growth in applications abroad, whereas these decreased for both Japan and the U.S.

Applicants residing in China, while ranking first in terms of resident applications, filed considerably fewer applications abroad (51,522). However, applications filed abroad from China have increased markedly in recent years – from around 7,000 in 2006 to the 51,522 filed in 2016. Among large middle-income origins, India (47.5%), Mexico (45.2%), Malaysia (42.5%), South Africa (28.9%) and Brazil (27.3%) have a high proportion of applications abroad as a share of total applications. The bulk of filings abroad from these origins were destined for the USPTO.

Among other factors, technological specialization, proximity and market size influence cross-border applications. U.S. applicants accounted for more than half of all non-resident applications filed in Norway (72.4%), Turkey (57.4%), Canada (52.8%), Mexico (51.3%) and Australia (50.1%). At many offices, applicants from Germany, Japan or the U.S. accounted for the highest non-resident shares. For example, applicants from Germany had the highest share of non-resident filings in Italy (33.2%), Switzerland (31.4%) and France (26.3%). Japanese applicants accounted

for a high share of the total in Germany (35.2%), the Republic of Korea (32.5%) and Indonesia (29.4%).

### *More than 1.4 million patent applications for unique inventions were filed worldwide in 2014*

Patent applicants traditionally file at their national offices and then subsequently abroad. This means some inventions are recorded more than once. To take this into account, WIPO has developed indicators for patent families, and the trend in patent families mirrors that for patent applications. The total number of patent families worldwide increased from around 1 million in 2010 to just over 1.42 million in 2014. Applicants from China (47.3%), Japan (16.7%) and the U.S. (11.9%) accounted for three-quarters of all patent families in 2014.

Over the past 20 years, the ratio of families to applications has remained more or less stable at around 0.52. This means that just over half of all applications are initial filings and the others repetitive filings, mostly at foreign offices (figure 5). Belgium, Denmark, Norway, Switzerland and Turkey have low family-to-application ratios – around 0.17 for the period from 2012 to 2014 – indicating substantial multiplication due to high numbers of cross-border filings. Conversely, China and the Russian Federation have high ratios of around 0.8, indicating less duplication due to low numbers of cross-border filings.

**Figure 5**  
**Patent applications and patent families worldwide**

## Patent families

A patent family is a set of interrelated patent applications filed in one or more offices to protect the same invention. The patent applications in a family are interlinked by one or more of: priority claim, Patent Cooperation Treaty (PCT) national phase entry, continuation, continuation-in part, internal priority and addition or division. A special subset comprises foreign-oriented patent families, that is, those patent families that have at least one filing office different from the office of the applicant's country of origin. Some foreign-related patent families include only one filing office because applicants may choose to file only with a foreign office. For example, if a Canadian applicant files a patent application directly with the USPTO without having previously filed with the patent office of Canada, that patent family will constitute a foreign-oriented patent family with just one office.

The size of patent families (i.e., the number of offices) reflects their geographical coverage. Around 81% of patent families created worldwide between 2012 and 2014 were filed in a single office. There is considerable variation among top origins, however. For example, around one-third of all patent families originating from the Netherlands, Sweden and Switzerland cover a single office, whereas single-office patent families account for 97% of all families for China and the Russian Federation. Focusing exclusively on foreign-oriented patent families shows that on average such families cover three foreign offices. Among the top origins, applicants from Switzerland tend to cover four offices when filing abroad, whereas those from Canada cover two on average.

### *The top 10 patent applicants worldwide are Asia-based multinationals*

Canon Inc. of Japan was the top applicant for the period from 2011 to 2014, with 30,476 patent families worldwide. It was followed by Samsung Electronics (26,609) of the Republic of Korea and Japanese companies Panasonic (22,899), Toshiba (22,627) and Toyota Jidosha (22,190). The top 10 applicants are all located in Asia. The highest-ranking non-Asian applicant was Robert Bosch of Germany (16,582) at number 12.

More than a quarter (26.9%) of Canon's patent families during this period related to optics technology, while computer technology accounted for the highest share of families belonging to Samsung Electronics (26%) and Toshiba (16.1%). For Panasonic, electrical machinery (22.7%) was the most important technology field. Transport (24.2%) saw the highest share of all patents for Toyota Jidosha.

Applicants from just nine origins make up the top 100 list for the period from 2011 to 2014. Japan (40) had the highest number of applicants in this list, followed by China (26), the Republic of Korea (15),

the U.S. (9), Germany (6) and one each from France, the Netherlands, Sweden and Taiwan, Province of China. The top 100 list mainly comprises multinational companies. However, 14 Chinese universities also feature. Combined, these 14 applicants accounted for 9% of all patent families held by the top 100 applicants.

### *The Republic of Korea filed the highest number of patents per unit of GDP*

Variations in patenting activity across countries reflect differences in their levels of economic growth and development. It is therefore informative to examine resident patent activity with regard to population, R&D spending, GDP and other variables. These are commonly referred to as "patent activity intensity" indicators.

Since 2004, the Republic of Korea has had the highest number of patent applications per unit of USD 100 billion GDP. Its ratio of resident applications to GDP is considerably higher than those of China and Japan, ranked second and third, respectively (figure 6). For the first time since 2010, the top five ranking has changed. After surpassing Germany in 2010, China has moved ahead of Japan to rank second. The gap between China and the Republic of Korea has narrowed rapidly. Reflecting strong growth in resident applications, China's resident applications per unit of GDP increased from 1,455 in 2006 to 6,069 in 2016 – the fastest growth among the top origins. Germany and Switzerland are ranked fourth and fifth, respectively. Between 2006 and 2016, Germany's resident patent applications per GDP unit fell from 2,260 to 2,019, while those of Switzerland rose from 1,768 to 1,841.

The list of the top 20 origins is predominantly comprised of high-income countries. However, three middle-income countries – China, the Russian Federation and Ukraine – also feature. The rank of the top 20 origins has been stable for the past 10 years, with little movement in country rankings except that of China.

**Figure 6****Resident patent applications per USD 100 billion GDP for the top 10 origins**

■ 2006 ■ 2016

Source: Standard figure A41.

Despite sizable increases in their resident patent application to GDP ratios between 2006 and 2016, large middle-income countries such as Brazil, India, Malaysia and Mexico exhibit low numbers of resident applications per unit of GDP. Brazil, with 406 resident applications per unit of GDP, is the highest-placed origin in Latin America and the Caribbean, while South Africa ranks highest in Africa with 179.

The profile of resident applications per million population is similar to that adjusted by GDP, but shows some subtle differences. The Republic of Korea retains its lead. However, Japan ranks second in this regard. China ranks much lower – sixth, after Germany – due to its high population. Small high-income countries of origin such as Finland, Luxembourg, Norway and Singapore rank high when resident patent applications are adjusted by population or GDP. Among the large middle-income countries of origin, India and Mexico each filed 10 resident applications per million population, despite India's number of resident applications being 10 times higher than that of Mexico. Similarly, Chile has a higher ratio of resident applications to population than Argentina, even though Argentina has twice as many resident applications as Chile.

### *Computer technology remains the most frequently featured technology field in applications*

In 2015 – the latest year for which complete data are available due to the delay between application and publication – computer technology was the most frequently featured technology in published patent applications worldwide with around 187,000 published applications. It was followed by electrical machinery (176,400), measurement (124,000), digital communication (123,300) and medical technology (110,100). These five fields accounted for 28.6% of all published applications worldwide.

Among the top 20 technology fields, food chemistry (+10.9%), digital communication (+8.7%), materials metallurgy (+8.1%) and basic materials chemistry (+7.7%) witnessed the fastest average annual growth between 2005 and 2015. Food chemistry rose from around 22,400 published applications in 2005 to around 63,200 in 2015, while digital communication increased from 53,600 to 123,300 over the same period. In contrast, there was a slight decline in published patent applications for optics (-0.9%), audio-visual technology (-1.5%) and telecommunications (-1.8%).

Among the top 10 origins in the period from 2013 to 2015, China, Japan and the Republic of Korea filed most heavily in electrical machinery; France and Germany in transport; Switzerland and the United Kingdom (U.K.) in pharmaceuticals; the Netherlands in medical technology; the Russian Federation in food chemistry; and the U.S. in computer technology. The combined share of the top three technologies for the top 10 origins ranged from 15.4% for the U.K. to 27.2% for the U.S.

Among the large middle-income countries in the period from 2013 to 2015, applicants residing in India filed most heavily in computer technology (17.4% of total published applications); Turkey (12.7%) and Mexico (11%) in pharmaceuticals; and South Africa in civil engineering (8.3%).

The top technology field – computer technology – accounted for a high share of published patent applications originating from Barbados (16.2%), Bermuda (14.5%), Israel (13%), China Hong Kong SAR (10.8%) and Singapore (10.7%) for the period from 2013 to 2015.

### ***Patents granted by the EPO grew by 40% in 2016 – the fastest growth since 1983***

Offices carry out a formal and substantive examination to decide whether or not to issue a patent. The procedure for granting a patent varies across offices, and differences in the numbers of granted patents among offices depend on factors such as examination capacity and procedural delays. For this reason, application data for a given year should not be compared with grant data from the same year.

In 2016, an estimated 1.35 million patents were granted worldwide, up 8.9% on 2015 (figure 7). Growth in 2016 was the fastest since 2012. This was due mainly to the increase at both the EPO and SIPO. The EPO granted 27,500 more patents in 2016 than in 2015, while SIPO issued 48,900 additional patents.

SIPO granted 404,208 patents in 2016, followed by the USPTO (303,049), the JPO (203,087), KIPO (108,875)

and the EPO (95,956). These five offices issued more than 1.1 million patents between them – 83% of the world total. Patents granted by the EPO grew by 40.2% in 2016 – the fastest growth since 1983. SIPO (+12.5%), the JPO (+7.3%), KIPO (+6.9%) and the USPTO (+1.6%) also issued more patents in 2016 than in 2015.

**Figure 7**  
**Patent grants worldwide**

Source: Standard figure A3.

Among the top 20 offices, the Philippines saw the fastest growth (+82.1%), with grants increasing from 2,200 in 2015 to 4,006 in 2016. This reflected a substantial increase in the number of non-resident grants. India (+37%), Brazil (+23%) and Canada (+19%) were the other top 20 offices to exhibit double-digit growth in 2016. Again, growth in non-resident grants drove overall growth for these offices.

Beyond the top 20 list, Indonesia granted 3,674 patents in 2016, almost double the number for the previous year. The Islamic Republic of Iran and Malaysia each issued around 3,300 patents, while around 1,800 patents each were granted by Argentina and Turkey. All these offices saw strong annual growth in patent grants.

Asia's share of worldwide patent grants was 57% in 2016 – considerably below its share of applications (64.6%). However, its share of grants has increased

from 48.8% in 2006 to 57% in 2016. Offices located in North America accounted for a quarter of patent grants worldwide in 2016, which is similar to the region's 2006 share. Offices in Europe accounted for 14.5% of the 2016 world total, while the combined share for Africa, Latin America and the Caribbean and Oceania was 4.1%.

### *Around 2.8 million patents are in force in the U.S.*

Patent rights generally last for up to 20 years from the date the application was filed. The estimated number of patents in force worldwide rose from 7.8 million in 2009 to 11.8 million in 2016.

The USPTO recorded the most, with 2.8 million patents in force in 2016, followed by the JPO (2 million), SIPO (1.8 million) and KIPO (1 million). Just these four jurisdictions cover around 63% of all patents in force worldwide. The top 20 list includes 16 offices from high-income countries and four from upper middle-income countries, namely China, Mexico, the Russian Federation and South Africa. Offices of other large middle-income countries with substantial numbers of patents in force are Turkey (63,500), India (50,000), Malaysia (25,000) and Brazil (24,000). Denmark (55,700), Singapore (48,600) and Finland (48,600) – three small high-income countries – had large numbers of patents in force in their jurisdictions.

Holders must pay maintenance/renewal fees to maintain the validity of their patents, and may opt to let a patent lapse before the end of its full term. For the 72 offices that reported their in-force data broken down by year of filing, between 40% and 43% of patents granted remained in force for at least 6 to 10 years after the filing date, and about one-fifth lasted the full 20 years.

Although patents can be maintained for 20 years, the average age of patents varied across offices. For example, the average age of all patents in force 2016 in India was 12.8 years, while in China it was 7.2 years. Along with India, Germany (11.6 years), Canada (11)

and Denmark (10.9) also have high average ages of patents in force.

### *The top four offices had fewer potentially pending applications in 2016 than in 2015*

Patent offices must assess whether the claims in applications meet the standards of novelty, non-obviousness and industrial applicability defined in national laws. Processing patents therefore consumes time and resources.

The number of applications that were potentially pending globally fell from 5.6 million in 2009 to 5 million in 2016. This estimate is based on data from 108 offices. However, the figure would be higher if data from SIPO were available. The decline in applications pending worldwide was driven mainly by Japan, which saw potentially pending applications decline from around 1.6 million in 2009 to 0.8 million in 2016.

The USPTO had the most potentially pending applications in 2016 with 1.1 million, followed by the JPO (around 847,000) and the EPO (668,000). However, the USPTO has seen eight successive years of reduction in the number of potentially pending applications, while the JPO has reported declines each year since 2005. The EPO saw 2.3% fewer potentially pending applications, representing the first decrease since at least 2004. This was partly due to a substantial increase in the number of patent applications processed and granted in 2016. A large share of the EPO's (70%) and the JPO's (79%) potentially pending applications was awaiting request for examination. In such cases, even if these offices have resources to process and reduce the number of pending applications, they will be unable to do so until they receive a request for examination from applicants.

Among middle-income countries, Brazil had the largest number of potentially pending applications: they almost doubled, from around 123,200 in 2006 to around 243,800 in 2016. India saw a 6.1% increase in its potentially pending applications in 2016. However, 80% of the total (242,800) were awaiting request for examination.

## Potentially pending applications

Potentially pending applications include all patent applications, at any stage in the process, awaiting a final decision by a patent office, including those applications for which applicants have not filed a request for examination (where applicable).

### ***A record number of international patent applications were filed through the PCT System in 2016***

An international treaty administered by WIPO, the Patent Cooperation Treaty (PCT), allows applicants to seek patent protection for an invention simultaneously in a large number of countries by filing a single PCT international application. The granting of patents remains under the control of national and regional patent offices and is carried out in what is called the “national phase” or “regional phase.”

The number of PCT applications grew by 7.2% in 2016 – the fastest increase since 2011 and the seventh consecutive year of growth. Around 233,000 PCT applications were filed in 2016. Applicants based in the U.S. filed the largest number of PCT applications with 56,590, followed by applicants from Japan (45,214), China (43,094), Germany (18,305) and the Republic of Korea (15,552).

Fourteen of the top 20 origins filed more PCT applications in 2016 than in 2015. China recorded extraordinary growth (+44.4%), while Italy (+9.4%), Israel (+9.1%), India (+8.2%) and the Netherlands (+7.9%) also saw strong increases. In contrast, for the second successive year Canada (-17.3%) saw a substantial decline in filings, linked to a declining number of applications filed by Research in Motion and Nortel.

### ***Utility model applications worldwide increased by 28.9%***

A utility model is a special form of patent right granted by a state or jurisdiction to an inventor or the inventor’s assignee for a fixed period of time. The terms and conditions for granting a utility model are slightly different from those for normal patents, including a shorter term of protection and less stringent patentability requirements.

In 2016, utility model applications increased by 28.9%, amounting to 1.55 million applications. This strong growth was primarily due to a 30.9% increase in applications filed at SIPO. In 2016, SIPO received nearly 95% of all utility model applications filed in the world – the remaining 73 offices accounted for just 5% of the world total. China (1.48 million) was followed by Germany (14,030) and the Russian Federation (11,112). Ukraine (9,584) exhibited rapid growth and surpassed

the Republic of Korea (7,764) as the fourth highest office for utility model applications.

Among the top 20 offices, the Philippines (+42.3%), Kazakhstan (+35.1%) and Indonesia (+32.2%) witnessed sharp growth in 2016 – albeit from a low base. The numbers of applications filed in Japan and the Republic of Korea have declined drastically over the past 10 years. Applications filed in Japan fell from 10,965 in 2006 to 6,480 in 2016, while those in the Republic of Korea declined from 32,908 to 7,767.

Utility model applications are rarely filed abroad: resident applications made up about 99% of all applications filed worldwide in 2016. Among the top 10 offices, resident shares varied between 95% and 99%, except in Germany (72%) and Japan (76%), which had lower resident shares.

### ***Women’s participation rate in patent applications tends to be high in technology fields related to life sciences***

The share of PCT applications with women inventors increased from 21.7% in 2002 to 29.7% in 2016. The 2016 figure is one percentage point higher than that for 2015. The total number of PCT applications with women inventors almost tripled, from around 22,600 to around 62,400, over the same period. Women’s participation rate varied across countries. Among the top 20 origins, the Republic of Korea (46.9%) and China (46.8%) were the most gender-equal. Spain (36%), the U.S. (31.5%) and France (31.5%) also had relatively high shares of PCT applications with women inventors.

Technology fields related to the life sciences have relatively high shares of women inventors in PCT applications. Biotechnology (58.3%) had the highest share, followed by pharmaceuticals (56.4%), organic fine chemistry (54.7%) and food chemistry (51%).

The women’s participation rate based on national/regional patent office application data is lower than that based on PCT application data. Among offices for which data were available, the share of resident patent applications with women inventors ranged from 11.1% at the German patent office to 38.7% at the Russian patent office in 2014. That Germany has the largest gender gap could be due in part to the fact it has a high number of patent filings in fields of technology, such as transport and mechanical engineering, for which the participation rates for women are low.

# Patent applications and grants by office

**Figure A5**  
**Patent applications by income group**

Income group	Number of applications		Resident share (%)		Share of world total (%)		Average growth (%)
	2006	2016	2006	2016	2006	2016	2006-16
High-income	1,402,100	1,552,800	63.3	59.1	78.3	49.6	1.0
Upper middle-income	327,700	1,489,100	51.8	85.3	18.3	47.6	16.3
Lower middle-income	53,800	76,000	21.7	26.7	3.0	2.4	3.5
Low-income	7,400	10,000	86.5	86.0	0.4	0.4	3.1
<b>World</b>	<b>1,791,000</b>	<b>3,127,900</b>	<b>60.0</b>	<b>70.9</b>	<b>100.0</b>	<b>100.0</b>	<b>5.7</b>

Note: Totals by income group are WIPO estimates using data covering 154 offices. Each category includes the following number of offices: high-income countries/economies (58), upper middle-income (43), lower middle-income (37) and low-income (16). European Patent Office data are allocated to the high-income group because most of its member states are high-income countries. For similar reasons, data for the African Regional Intellectual Property Organization and the African Intellectual Property Organization are allocated to the low-income group, while those for the Eurasian Patent Organization are allocated to the lower middle-income group. For information on income group classification, see the Data description section.

**Figure A7**  
Trend in patent applications for the top five offices

Note: EPO is the European Patent Office. The top five offices were selected based on their 2016 totals.  
Source: WIPO Statistics Database, September 2017.

**Figure A8**  
Patent applications at the top 20 offices, 2016

.. indicates not available.

Note: EPO is the European Patent Office. In general, national offices of European Patent Office (EPO) member states receive lower volumes of applications because applicants may apply via the EPO to seek protection within any EPO member state. The number of applications broken down by resident and non-resident is not available for Indonesia.

Source: WIPO Statistics Database, September 2017.

**Figure A9**  
**Contribution of resident and non-resident applications to total growth for the top 20 offices, 2015-16**

■ CONTRIBUTION OF RESIDENT APPLICATIONS ■ CONTRIBUTION OF NON-RESIDENT APPLICATIONS

.. indicates not available.

Note: EPO is the European Patent Office. This figure shows total growth or decrease in applications at each office broken down by the respective contributions of resident and non-resident applications. For example, applications filed in the U.S. grew by 2.7%. Growth in resident applications accounted for 1.2 percentage points of this increase, whereas the remaining 1.5 percentage points reflected growth in non-resident applications. Resident and non-resident contributions are not available for Indonesia, the Islamic Republic of Iran and Italy.

**Figure A15**  
**Patent grants for the top 20 offices, 2016**

Note: EPO is the European Patent Office. The procedure for issuing patents varies across offices, and differences in the numbers of patents granted among offices depend on factors such as examination capacity and procedural delays. The examination process can also be lengthy, so there is a time lag between application and grant dates. For this reason, data on applications for a given year should not be compared with data on grants for the same year.

# Patent families

**Figure A23**  
**Trend in patent families worldwide**

**■ PATENT FAMILIES ■ GROWTH RATE (%)**

Note: Applicants often file patent applications in multiple jurisdictions, so some inventions are recorded more than once. To take this into account, WIPO has indicators related to patent families, defined as patent applications interlinked by one or more of: priority claim, Patent Cooperation Treaty national phase entry, continuation, continuation-in-part, internal priority and addition or division. Patent families here include only those associated with patent applications for inventions and exclude patent families associated with utility model applications.

Sources: WIPO Statistics Database and EPO PATSTAT database, October 2017.

**Figure A24**  
**Trend in foreign-oriented patent families worldwide**

**■ FOREIGN-ORIENTED PATENT FAMILIES ■ GROWTH RATE (%)**

Note: A special subset of patent families comprises foreign-oriented patent families: this includes only patent families that have at least one filing office different from the office of the applicant's country of origin. Some foreign-oriented patent families include only one filing office, because applicants may choose to file directly with a foreign office. For example, if a Canadian applicant files a patent application directly with the USPTO without previously filing with the patent office of Canada, that application and applications filed subsequently with the USPTO will form a foreign-oriented patent family. The sharp drop in foreign-oriented patent families in 2014 shown here may partly reflect incomplete data.

Sources: WIPO Statistics Database and EPO PATSTAT database, October 2017.

**Figure A25**  
**Domestic and foreign-oriented patent families for the top 20 origins, 2012-14**

Note: A patent family is defined as patent applications interlinked by one or more of: priority claim, Patent Cooperation Treaty national phase entry, continuation, continuation-in-part, internal priority and addition or division. Patent families here include only those associated with patent applications for inventions and exclude patent families associated with utility model applications.

Sources: WIPO Statistics Database and EPO PATSTAT database, October 2017.

**Figure A26**  
**Distribution of patent families by number of offices for the top 20 origins, 2012-14**

Note: A patent family is defined as patent applications interlinked by one or more of: priority claim, Patent Cooperation Treaty national phase entry, continuation, continuation-in-part, internal priority and addition or division. Patent families here include only those associated with patent applications for inventions and exclude patent families associated with utility model applications.

Note: A patent family is defined as patent applications interlinked by one or more of: priority claim, Patent Cooperation Treaty national phase entry, continuation, continuation-in-part, internal priority and addition or division. Patent families here include only those associated with patent applications for inventions and exclude patent families associated with utility model applications.

A patent family is defined as patent applications interlinked by one or more of: priority claim, Patent Cooperation Treaty national phase entry, continuation, continuation-in-part, internal priority and addition or division. Patent families here include only those associated with patent applications for inventions and exclude patent families associated with utility model applications. WIPO's IPC technology concordance table was used to convert IPC symbols into 35 corresponding fields of technology (see Annex A for details).

Note: Data refer to published patent applications. There is a minimum delay of 18 months between the application date and the publication date. WIPO's IPC technology concordance table was used to convert IPC symbols into 35 corresponding fields of technology (see Annex A for details). The top 10 origins were selected based on their 2013-15 total published applications.

Sources: WIPO Statistics Database and EPO PATSTAT database, October 2017.

**Figure A35**  
**Trend in patent applications in energy-related technologies**

■ SOLAR ENERGY ■ FUEL CELL TECHNOLOGY ■ WIND ENERGY TECHNOLOGY ■ GEOTHERMAL ENERGY

Note: For definitions of the technologies – fuel cells, geothermal, solar and wind energy – see Annex B. The correspondence between IPC symbols and technology fields is not always clear (there is no one-to-one relationship). It is thus difficult to capture all patents in a specific technology field. Even so, the IPC-based definitions are likely to capture the vast majority of patent applications in these areas. Data refer to published patent applications.

# Patent applications by gender

**Figure A36**  
**Women inventors in PCT applications**

Note: In order to attribute gender to inventors' names recorded in PCT applications, WIPO produced a world gender-name dictionary based on information from 13 different public sources. Gender is attributed to a given name on a country-by-country basis because certain names can be considered male in one country but female in another.

Sources: WIPO Statistics Database, September 2017.

**Figure A37**  
**Share of PCT applications with women inventors for the top 20 origins, 2016**

Note: In order to attribute gender to inventors' names recorded in PCT applications, WIPO produced a gender-name dictionary based on information from 13 different public sources. Gender is attributed to a given name on a country-by-country basis because certain names can be considered male in one country but female in another.

Sources: WIPO Statistics Database, September 2017.

**Figure A38****Share of PCT international patent applications with women inventors by field of technology, 2016**

Note: In order to attribute gender to inventors' names recorded in PCT applications, WIPO produced a gender-name dictionary based on information from 13 different public sources. Gender is attributed to a given name on a country-by-country basis because certain names can be considered male in one country but female in another.

# Patent applications in relation to GDP and population

**Figure A41**  
Resident patent applications per USD 100 billion GDP for the top 20 origins

Note: GDP data are in 2011 US PPP dollars. The top 20 origins were included if they had a GDP greater than USD 25 billion PPP and more than 100 resident patent applications. Due to space constraints, only the top 20 origins that fulfil these criteria are presented.

Sources: WIPO Statistics Database and World Bank, September 2017.

**Figure A42**  
Resident patent applications per million population for the top 20 origins

Note: The top 20 origins were included if they had a population greater than 5 million and if they had more than 100 resident patent applications. Due to space constraints, only the top 20 origins that fulfil these criteria are presented.

Sources: WIPO Statistics Database and World Bank, September 2017.

# Patents in force

**Figure A43**  
Trend in patents in force worldwide

Note: World totals are WIPO estimates using data covering 107 offices.  
Sources: WIPO Statistics Database, September 2017.

**Figure A44**  
Patents in force at the top 20 offices, 2016

.. indicates not available.

Sources: WIPO Statistics Database, September 2017.

**Figure A45**  
**Patents in force in 2016 as a percentage of total applications**

Note: Percentages are calculated as the number of patent applications filed in year  $t$  and in force in 2016, divided by the total number of patent applications filed in year  $t$ . Patent holders must pay maintenance fees to maintain the validity of their patents. Depending on technological and commercial considerations, patent holders may opt to let a patent lapse before the end of the full protection term. This figure shows the distribution of patents in force in 2016 as a percentage of total applications in the year of filing. But not all offices provide these data. Data for 72 offices show that 40-43% of the applications for which patents were eventually granted remained in force for at least 6 to 10 years after the application date. About 21% of these patents lasted the full 20-year patent term.

Sources: WIPO Statistics Database, September 2017.

# Pending patent applications

**Figure A47**  
Potentially pending applications at the top offices

Note: EPO is the European Patent Office. Application processing varies across offices, making it difficult to measure pending applications. In some offices patent applications automatically proceed to the examination stage unless applicants withdraw them; in others, applications do not proceed to examination unless applicants file a separate request for examination. To take account of procedural differences, pending application data are separated between (a) all patent applications, at any stage in the process, that are awaiting a final decision by a patent office, including those for which applicants have not filed a request for examination (where applicable) and (b) patent applications undergoing examination for which the applicant has requested examination (where such separate requests are necessary). Data for the State Intellectual Property Office of the People's Republic of China (SIPO), the office that receives the most applications, were unavailable.

Sources: WIPO Statistics Database, September 2017.

**Figure A48**  
Potentially pending applications at the top 20 offices, 2016

.. indicates not available.

Note: EPO is the European Patent Office. Potentially pending applications include all patent applications, at any stage in the process, awaiting a final decision by a patent office, including those for which applicants have not filed a request for examination (where applicable). Data for Brazil include both pending patent and utility model applications, and so are not comparable with other offices.

\* indicates data based on office of earlier examination rather than office of first filing.

Note: EAPO is the Eurasian Patent Organization and EPO is the European Patent Office. A patent prosecution highway is a bilateral agreement between two offices that enables applicants to request a fast-track examination whereby patent examiners can use the work of the other office.

Source: WIPO Statistics Database, September 2017.

**Figure A58**  
**Flow of PPH requests between offices of first filing and offices of later examination, 2016**

\* indicates data based on office of earlier examination rather than office of first filing.

Note: EPO is the European Patent Office. Japan data refers to the office of earlier examination rather than the office of first filing. A patent prosecution highway is a bilateral agreement between two offices that enables applicants to request a fast-track examination whereby patent examiners can use the work of the other office. This graph shows the flows of PPH requests between offices of first filing and offices of later examination.

# Utility model applications

**Figure A59**  
Trend in utility model applications worldwide

Note: World totals are WIPO estimates using data covering 74 patent offices. These totals include applications filed directly with national and regional offices and applications entering offices through the Patent Cooperation Treaty national phase (where applicable).

(a) Equivalent applications by origin data are incomplete because some offices do not report by origin.

(b) 2015 data are reported for applications by office.

(c) 2015 data are reported for equivalent applications by origin.

(d) The office did not report resident applications so the equivalent applications by origin data may be incomplete.

(e) The International Bureau acts as the receiving office for PCT applications.

(f) The African Intellectual Property Organization (OAPI) acts as the receiving office for PCT applications.

(g) The Swiss Federal Institute of Intellectual Property acts as the receiving office for PCT applications.

(h) The African Regional Intellectual Property Organization (ARIPO) acts as the receiving office for PCT applications.

(i) The African Intellectual Property Organization (OAPI) is the competent office for processing applications.

# Trademarks

## Highlights

### *Applications grew by 16.4% in 2016*

An estimated 7 million trademark applications were filed worldwide in 2016, 16.4% more than in 2015 (figure 8). This marks the seventh consecutive year of growth. There are now almost three times as many trademark applications being filed around the world than in 2001 – applications have increased every year except for three during that period, and five years saw annual growth exceed 10%.

Trademark applications dipped in 2001, but returned to growth the following year. After slowing in 2007 and showing slight declines in 2008 and 2009, they rebounded in 2010 and have continued to increase year on year. For each year since 2010, large numbers of applications filed in China have accounted for between 50% and 85% of the increases in overall growth.

When differences in filing systems across national and regional offices are harmonized using the application class count, trademark filing activity in 2016 also saw a double-digit increase, up 13.5% on the previous year. The total number of classes specified in applications – known as the application class count – reached an estimated 9.77 million (figure 9). Excluding the 2016 application class count for China, trademark filing activity grew by a more moderate 5% in the rest of the world.

## Class count

A trademark application may refer to different classes of goods or services. Many offices use the Nice Classification, an international classification of goods and services for registering trademarks and service marks. Applications received by these offices are classified in one or more of the 45 Nice classes (see [www.wipo.int/classifications/nice](http://www.wipo.int/classifications/nice)). Some offices allow single-class filing only, meaning applicants have to file a separate application for each class. Others permit multi-class filings, enabling applicants to file a single application in which a number of classes can be specified. To improve international comparisons of the numbers of applications received, it helps to compare class counts across offices. Class counts are also used to make trademark registration activity internationally comparable. This method for comparing offices began in 2004, the first year for which complete class count data are available.

### Offices with the most filing activity

As with other forms of intellectual property (IP), the increase in trademark filing activity (measured in application class counts) largely reflects high numbers of trademark applications filed in China. In 2016, the trademark office of China accounted for 75% of the annual increase in global trademark filing activity. It was followed by the office of Japan, which accounted for 9% of total growth.

The office of China's class count of almost 3.7 million was followed by a count of 545,587 at the office of the United States of America (U.S.) (figure 10). These have been the top two offices since the early 2000s, but since 2006 China's class count has grown from double that of the U.S. to over six times as much. These two offices were followed by that of Japan (451,320), the European Union Intellectual Property Office (EUIPO; 369,970) and that of India (313,623). The top five offices accounted for 55% of all trademark filing activity in 2016, up from 34% a decade earlier in 2006.

Among the top 20 offices, over half had more trademark filing activity in 2016 than in 2015, with the largest increases of 30.8% recorded in both China and Japan, followed by double-digit growth in Viet Nam (+21.1%), the United Kingdom (U.K.; +19.1%) and the Russian Federation (+14.8%). Conversely, the offices of France (-3.1%) and the Republic of Korea (-1.7%) saw declines.

For offices located in low- and middle-income countries, annual growth was particularly high in Madagascar (+22.1%), Pakistan (+28.8%) and Yemen (+33.7%). The offices of Morocco, the Philippines and Uzbekistan saw double-digit growth of about 12-14%.

At most offices, trademark applications are filed mainly by residents seeking protection within their domestic jurisdiction. In 2016, residents accounted for 79.8% of global filing activity. In fact, domestic filing is becoming increasingly pronounced as a share of total filing activity, with the world resident application class count having increased by 15.5% on the previous year; in contrast, that for non-residents increased by only 6%.

Due largely to the high number of resident trademark applications in China, the global non-resident share of filing activity declined by almost 13 percentage points from a peak of 33.1% in 2004 to 20.2% in 2016. However, when the figures for China are excluded, the non-resident share fell by only around 7 percentage points over the same period.

Of the top 20 offices, half had non-resident filing shares of around 20% or greater, with Australia (39.7%), Canada (47%), Mexico (30.3%), Switzerland (59%) and Viet Nam (33%) recording the highest. The lowest non-resident shares were recorded at the offices of China (4.6%), France (5.9%) and the Islamic Republic of Iran (6.9%). The low non-resident shares for France and other EU member state offices can be explained by the fact that many non-resident applicants file for protection in these countries via the EUIPO.

Resident filing activity drove the double-digit growth in China, Japan, the Russian Federation, the U.K. and Viet Nam as well as growth at several other top 20 offices, whereas non-resident filing activity accounted for most or all of the total growth in Australia, the EUIPO, Switzerland and the U.S. In Canada, France, Germany and the Republic of Korea, declines in total filing activity can be attributed entirely or mainly to a drop in resident applications.

**Figure 10**  
**Trademark application class counts for the top 10 offices, 2016**

■ RESIDENT ■ NON-RESIDENT

Source: Standard figure B10.

The list of top 20 offices in 2016 is largely similar to that in 2015, but with a somewhat different ranking and several new additions. Due to the recent provision of application class counts by the Islamic Republic of Iran, its office appears for the first time among the top 20 offices at number 11. Another new arrival is the office of Viet Nam, which enters the list at number 19. As for changes in ranking, Japan moved up one place ahead of the EUIPO, replacing it as the third largest office in terms of trademark filing activity. For the second year running, India ranks among the top five offices in trademark filing activity. The Russian Federation moved up two places to number seven, ahead of both the Republic of Korea and Turkey.

Total application class counts at offices of high-income economies grew only slightly (+2%) between 2006 and 2016. This is lower than the average annual growth rates for all other income groups. The highest growth (+11.3%) over this 11-year period was recorded for offices of upper middle-income countries. Offices of lower middle-income (+5.7%) and low-income (+4%) countries also saw growth over the same period.

Twelve of the top 20 offices are in high-income economies, six are in upper middle-income countries (Brazil, China, the Islamic Republic of Iran, Mexico, the Russian Federation and Turkey) and two are in lower

middle-income countries (India and Viet Nam). In 2016, the offices of high-income countries together received 36.7% of total global filing activity, down from 55.5% in 2006. In contrast, the share for offices of upper middle-income countries rose from 33.7% in 2006 to 53.2% in 2016, due to their combined high average annual growth (figure 11). When China's statistics are removed from the upper middle-income group, the application class count for the other countries in this group still grew between 2006 and 2016, but at a lower rate of 4%. However, the combined share of the world total claimed by upper middle-income countries actually decreased from 19.3% to 15.4%. The shares of total filing activity for lower middle-income (9.4% in 2016) and low-income countries (0.7%) did not change much over the same period.

Eight of the top 20 offices in 2016 were located in Europe, seven in Asia, two each in Latin America and the Caribbean (LAC) and North America, and one in Oceania. Offices in Asia accounted for 60% of all trademark filing activity, up from 37% in 2006. This in part explains the decline in overall shares for the other five geographical regions over the same period (figure 12). Offices in Europe accounted for 21.5% of the world total in 2016, followed by North America (7.2%) and LAC (7%) – holding almost equal shares – and by Africa (2.4%) and Oceania (1.9%).

## Trademark filings since 1883

Trademark filings were fairly low and stable until the mid-1980s. Filings at China's office took off in the 1990s, and in 2001 they exceeded those received by that of the U.S., making China's office the largest in terms of applications received. Even so, filings in the U.S. have doubled since the mid-1990s despite declines at the end of the dot-com era in 2001 and 2002 and again during the financial crisis in 2008 and 2009. Having remained below 100,000 until 2006, India's trademark filings are now rapidly approaching 300,000. Trademark applications in the Republic of Korea stand at just over 180,000, and they are close to 170,000 in Brazil.

## Trend in trademark applications for the top five offices

Source: Standard figure B9.

## Map 2

### Equivalent trademark application class counts by origin, 2016

Source: Standard map B19.

## Equivalent application class count

Applications at some regional IP offices are equivalent to multiple applications in the countries that are members of the organizations establishing those offices. For example, to calculate the number of equivalent applications for the EUIPO, each application is multiplied by the corresponding number of EU member states. So an application filed with the EUIPO by an applicant residing outside the EU is counted as 28 applications abroad – equivalent to the 28 member countries of the EU in 2016. An application filed by an applicant residing in an EU country is counted as 1 resident application and 27 applications abroad. The same multiplier is applied to the classes specified in these applications. The equivalent application class count concept is used for reporting data by origin.

### *German applicants continue to file the most applications abroad*

Trademark applications received by offices from resident and non-resident applicants are referred to as office data, whereas applications filed by applicants at a national/regional office (resident applications) or at foreign offices (applications abroad) are referred to as origin data. Here, trademark statistics based on the origin of the residence of the applicant are reported in order to complement the picture of trademark filing activity worldwide.

In terms of filing activity abroad based on equivalent class count, applicants from Germany seek protection for their marks outside their country more than those of any other origin, a position Germany has held since 2006. In 2016, German filing activity abroad reached an equivalent application class count of about 2.04 million, followed by applicants from the U.S. (1.22 million), the U.K. (1.07 million) and Italy (922,851).<sup>1</sup> The high equivalent class counts for applications abroad from these origins can be explained not only by their high application class counts at numerous offices abroad, but also their frequent use of the EUIPO – with its multiplier effect – to seek protection within the EU as a whole.

Looking at absolute counts – and so removing the EUIPO's multiplier effect – 95% of all filing activity (application class counts) by China-based applicants was in China alone, with only 5% attributed to those seeking protection abroad. The shares for resident filing and filing abroad were similar for applicants from Brazil, India and the Islamic Republic of Iran. Applicants residing in many other low- and middle-income countries also dedicated

less than 10% of their trademark filing activity to seeking protection abroad.

Among the top 20 origins, about 77% of filing activity by Switzerland-based applicants occurred outside the country. This high share of applications abroad as a proportion of total filing activity was followed by that of applicants from the U.S. (46%) and Germany (45%).

Applicants from the upper middle-income countries Mauritius (57%) and Serbia (55%) sought protection abroad for a considerable share of their trademark filing activity. For upper middle-income countries Colombia, the Russian Federation, Thailand and Turkey and the lower-middle income country El Salvador, the share was 12-13%.

When deciding where to seek trademark protection, applicants consider such factors as market size and geographical proximity. For example, 36% of all non-resident filing activity in Mexico in 2016 came from U.S. applicants, 10% from applicants in Germany and 6% from applicants in Switzerland (figure 13). Applicants from China (22%) and the U.K. (10%) accounted for the largest shares of non-resident trademark filing activity in the U.S., followed by applicants from Germany (9%). In China, the three origins accounting for the largest shares of non-resident filing activity were the U.S. (21%), the Republic of Korea (12%) and Germany (9%). For non-resident filing activity at the EUIPO, it was applicants from the U.S. (34%), China (17%) and Switzerland (12%).

In 2016, applicants from China surpassed those from Switzerland (16%) to become the most active foreign filers at the German IP office, accounting for 18% of application class counts in filings it received from abroad.

**Figure 13****Share of total non-resident filing activity by origin at selected offices**

Note: EUIPO is the European Union Intellectual Property Office.

Source: Standard figure B25.

**Adjusting for GDP and population**

Differences in trademark filing activity across countries may reflect both the size of their economies and their level of economic development. To compare trademark filing intensity across countries, it helps to measure resident application class counts relative to GDP or population level.

When resident trademark applications are viewed as class counts and adjusted by GDP, countries with a lower number of classes specified in resident applications such as New Zealand, Switzerland and Ukraine may rank higher than some countries that otherwise show higher class counts (for example Australia and Germany). Of selected origins, China (17,764), Ukraine

(14,021), the Republic of Korea (10,242), New Zealand (10,016) and Switzerland (7,755) exhibited among the highest ratios of resident application class count to GDP in 2016 (figure 14). China (+9,801), the Russian Federation (+2,374), Ukraine (+2,113) and Mexico (+2,002) saw particularly large increases in resident application class count per unit of GDP between 2006 and 2016. In the case of China, this was due to 2016 resident filing activity being over five times the level recorded in 2006. As for Ukraine, the increase in the ratio over this period was due to a 5.2% rise in resident filing activity coupled with a fall in GDP of 10.7%. In 2016, India, South Africa and Thailand each had a ratio of around 3,300, even though India's resident filing activity was close to 12 times that of residents of South Africa and about 7 times that of residents of Thailand.

**Figure 14**  
**Resident trademark application class count per USD 100 billion GDP**  
**for selected origins**

■ 2006 ■ 2016

Source: Standard figure B33.

The data reflecting application class count per million population present a somewhat different picture. Iceland – with a population of about 334,300 – reported a resident application class count of 4,550 per million, one of the most intensive among all countries of origin in 2016. Among selected origins, Switzerland (4,391) – with a population of approximately 8.4 million – had a similar resident application class count, followed by the Republic of Korea (3,583), Australia (3,374) and Germany (3,114). Panama, the Russian Federation and the U.S. had ratios of about 1,200-1,300 each, while the ratio for Armenia and Mexico was around 800 (see standard figure B34).

### ***Which classes and industries saw the most filing activity?***

Trademarks are registered in relation to particular classes of goods or services. The Nice Classification of goods and services is used in the international trademark system and at certain national and regional offices. Nice Classification statistics offer insights into the relative importance of different goods and services. Service class 35 (advertising, business management, business administration and office functions) has been number one since 2004 – when complete class counts first became available – and in 2016 was represented in 10.5% of

all reported trademark filing activity by class. Nice Class 35 is followed by goods class 9 (6.9%), which includes scientific, photographic, measuring instruments, recording equipment, computers and software; service class 41 (5.8%), which relates to education, entertainment and sports activities; and goods class 25 (5.7%), which includes articles of clothing.

The 11 service-related classes accounted for about 38% of all Nice classes specified in applications filed in 2016, up from 30% in 2004. Services classes accounted for just over a third of all filing activity in China, the Russian Federation and Viet Nam, and half or more in the offices of France, Japan and Spain.

It is useful to group the 45 Nice classes into 10 industry sectors. Agriculture, research and technology, and business services were the top three sectors in 2016, each accounting for between 13% and 18% of global reported trademark filing activity. In contrast, industries relating to chemicals (2.6%) and transportation (5.6%) accounted for the smallest shares (see standard figure B28). The distribution of total trademark applications across industries has remained stable for more than a decade.

Concordant with being the global top industry in terms of trademark filing activity, agriculture was

the top sector at the offices of China (22%), the Republic of Korea (20%) and the Russian Federation (16%). Research and technology was the top industry sector at the EUIPO (21%) and the offices of France (19%), Germany (18%), Japan (26%) and the U.S. (20%). In Turkey, business services topped the list of industry sectors, accounting for 19% of all trademark filing activity. Among the top 10, only the offices of India (23%) and the Republic of Korea (16%) listed health among their top three industry sectors for trademark filing.

#### ***4.61 million trademark registrations recorded worldwide in 2016***

After examination, an office may decide to register a trademark. The number of registrations issued can fluctuate greatly from year to year, due in part to the resources dedicated by offices to examining trademark applications. For this reason, one should not compare the number of applications filed at an office in a given year with the number of registrations issued by that office in the same year.

The estimated 4.61 million trademark registrations recorded worldwide in 2016 represents an increase of 4.3%, or 191,500 additional registrations, on the previous year's total.

Just as class counts make application activity internationally comparable, so they also permit a more meaningful comparison of registrations. In 2016, an estimated 6.55 million classes were specified in trademark registrations. After two years of double-digit growth, 2016 saw a return to a modest increase of 2.5%, similar to the level of growth recorded in 2013. India's office saw growth of 134% in trademark registration activity in 2016, accounting for 71% of the total global annual increase.

China's office registered trademarks in which about 2.27 million classes were specified, followed distantly by the EUIPO (330,379), and the offices of the U.S. (326,481) and Turkey (218,137).

Along with the very high annual growth in India, several other offices among the top 20 experienced large increases in registration activity, including Argentina (+16.5%), Canada (+14.9%) and the Russian Federation (+15.3%).

Many offices of EU countries – including the Benelux Office for Intellectual Property (BOIP) – have witnessed decreases in filing and registration activity in recent years. This is due in part to the alternative offered by the EUIPO, which provides a route to seek protection for trademarks not only in individual EU member countries, but in the EU as a whole.

#### ***Active trademarks increased by 8.7%***

Unlike most forms of IP, trademarks can be maintained indefinitely by payment of renewal fees at defined time intervals. In 2016, there were an estimated 39.1 million active trademark registrations at 136 offices worldwide, representing an increase of 8.7% on 2015.

Once again, the office of China accounted for the most trademark registrations in force in 2016, with about 12.38 million – a 19.6% increase on 2015. It was followed by the offices of the U.S. (2.12 million), Japan (1.85 million) and India (1.33 million). With between 1 and 1.1 million trademark registrations in force each, the EUIPO and the offices of Mexico and the Republic of Korea also recorded high numbers of active trademarks. Australia (607,871) had about the same number of trademark registrations in force as Indonesia (605,397), while the Russian Federation (557,405) and Canada (555,571) too had similar figures.

About 13.8 million trademark registrations in force at 65 offices in 2016 can be distributed according to the year in which they were initially registered. This represents 53% of the approximately 26.1 million trademark registrations recorded at these offices between 1983 and 2016.

Sixteen percent of these trademarks registered in 1983 remained in force in 2016, reflecting the enduring value of marks. For those registered in 2006 and later, the percentage rises above 50%. About half of these 13.8 million registrations in force have a recent registration date dating back only to 2010.

#### ***Madrid international trademark applications exceeded 50,000 for the first time***

To obtain trademark protection in multiple countries or jurisdictions, applicants can either file their applications directly at each individual office – known as the “Paris route” – or file an application for international registration through the Madrid System: the “Madrid route”

(see the glossary). In 2016, the Madrid System offered trademark holders the ability to obtain protection for their branded products and services in an area covering a total of 114 countries.

Madrid international applications totaled 53,493 in 2016, up 9.1% on 2015, marking the seventh consecutive year of growth and the fastest recorded since 2010. In fact, since 2001 the number of applications has increased in all but three years, each coinciding with economic downturns in the early 2000s and 2009. This prevailing growth is due partly to the expanding membership of the Madrid System and partly to a general upward trend in trademark application volumes worldwide.

For the third year in a row, the U.S. remained the largest user of the Madrid System. International applications filed by applicants located in the U.S. reached 7,730. These were followed by applications from Germany (7,544), France (4,124) and China (3,820). Applicants domiciled in China filed about 1,860 more Madrid

applications in 2016 than in 2015. This remarkably high growth of 94.7% pushed China up from eighth largest origin in 2015 to fourth largest in 2016.

Between 2006 and 2016, applicants for international registrations have accounted for between 63% and 77% of all non-resident trademark filing activity emanating from Madrid member jurisdictions at the IP offices of all Madrid members combined.

For many Madrid member offices, over half their non-resident trademark filing activity (application class counts) is received through the Madrid route. In 2016, this was the case for the offices of India (59.1%), Israel (76.3%), Japan (59.6%), the Republic of Korea (57.8%) and Turkey (73.2%), to name a few. The EUIPO (28.3%), and the offices of China (34.3%) and the U.S. (36%), however, received lower shares of total non-resident filing activity via the Madrid route. For further information and statistics, see the *Madrid Yearly Review 2017*.

## Trademark application class counts by income group

Income group	Application class count		Resident share (%)		Share of world total (%)		Average growth (%)
	2006	2016	2006	2016	2006	2016	2006-16
High-income	2,932,300	3,584,200	68.2	72.1	55.5	36.7	2.0
Upper middle-income	1,778,200	5,201,000	72.6	88.2	33.7	53.2	11.3
...Upper middle-income without China	1,018,500	1,503,100	61.1	70.6	19.3	15.4	4.0
Lower middle-income	525,300	916,700	56.3	65.0	9.9	9.4	5.7
Low-income	44,800	66,300	44.9	43.0	0.9	0.7	4.0
<b>World</b>	<b>5,280,600</b>	<b>9,768,200</b>	<b>68.3</b>	<b>79.8</b>	<b>100.0</b>	<b>100.0</b>	<b>6.3</b>

Note: Totals by income group are WIPO estimates using data covering 166 IP offices. Each category includes the following number of offices: high-income (62), upper middle-income (46), lower middle-income (40) and low-income (18). Data for the European Union Intellectual Property Office (EUIPO) are allocated to the high-income group because most EU member states are high-income countries. For similar reasons, data for the African Regional Intellectual Property Organization (ARIPO) and the African Intellectual Property Organization (OAPI) are allocated to the low-income group. For information on income group classification, see the Data description section.

**Contribution of resident and non-resident application class counts to total growth for the top 20 offices, 2015-16**

■ CONTRIBUTION OF RESIDENT APPLICATIONS    ■ CONTRIBUTION OF NON-RESIDENT APPLICATIONS

.. indicates not available.

Note: EUIPO is the European Union Intellectual Property Office. This figure shows, for each office, total growth or decreases in application class counts broken down by the respective contributions of resident and non-resident filing activity. For example, the total number of classes specified in trademark applications in India grew by 8.3%. Growth in resident filing activity accounted for 4.9 percentage points of this increase, whereas the remaining 3.4 percentage points came from non-resident filing activity. Resident and non-resident contributions are not available for the Islamic Republic of Iran and Italy.

# Trademark applications by origin

**Figure B19**

**Equivalent trademark application class counts by origin, 2016**

Note: Trademark filing activity by origin includes the number of classes specified in resident applications and in applications filed abroad. The origin of a trademark application is determined by the residence of the applicant. Applications filed at regional offices are considered equivalent to multiple applications in the relevant member states, and the classes specified in these applications are multiplied accordingly. See the glossary for the definition of equivalent application.

Source: WIPO Statistics Database, September 2017.

**Figure B20**

**Trademark application class counts for the top 20 origins, 2016**

.. indicates not available.

Note: In this figure, trademark application filing activity by origin includes the number of classes specified in resident applications and in applications filed abroad, and is based on absolute count, not equivalent count. The origin of a trademark application is determined by the residence of the applicant. An application filed at a regional office is considered a resident filing if the applicant is a resident of one of the relevant member states.

Source: WIPO Statistics Database, September 2017.

**Figure B21**  
**Trademark application class counts for selected low- and middle-income origins, 2016**

Note: In this figure, trademark application filing activity by origin includes the number of classes specified in resident applications and in applications filed abroad, and is based on absolute count, not equivalent count. The origin of a trademark application is determined by the residence of the applicant. The selected origins are from different world regions and income groups (low-income, lower middle-income and upper middle-income). Where available, data for all origins are presented in the statistical table at the end of this section.

Source: WIPO Statistics Database, September 2017.

**Figure B22**  
**Trademark application class counts abroad for the top 20 origins, 2016**

Note: This figure distinguishes between absolute counts and equivalent counts for filing activity abroad – that is, resident applications were excluded. Based on equivalent application class counts, applicants from Germany had the highest level of trademark filing activity abroad. This was due not only to their high application class counts at numerous foreign offices, but also to their frequent use of the European Union Intellectual Property Office (EUIPO) – with its multiplier effect – to seek trademark protection within the entire EU. See the glossary for the definition of equivalent application. The origin of a trademark application is determined by the residence of the applicant.

# Trademark registrations in force

**Figure B37**

**Trend in trademark registrations in force worldwide**

■ TRADEMARKS IN FORCE ■ GROWTH RATE (%)

Note: World totals are WIPO estimates using data covering 136 IP offices. Data refer to the number of trademark registrations in force, not the number of classes specified in those registrations. Trademark rights can be maintained indefinitely by paying renewal fees at defined time intervals. Trademarks in force provide information on the volume of trademark registrations currently active as well as the historical trademark life cycle.

Source: WIPO Statistics Database, September 2017.

**Figure B38**

**Trademark registrations in force at selected offices, 2016**

Note: EUIPO is the European Union Intellectual Property Office. Data refer to the number of trademark registrations in force, not the number of classes specified in those registrations.

Source: WIPO Statistics Database, September 2017.

**Figure B39**  
**Trademark registrations in force in 2016 as a percentage of total registrations**

Note: Percentages are calculated as follows: the number of trademark registrations issued in year *t* and in force in 2016 divided by the total number of trademark registrations issued in year *t*. Trademark holders must pay renewal fees to maintain the validity of their marks, which in most cases can be maintained indefinitely. This figure is based on about 13.8 million active trademark registrations reported by 65 offices that provided a breakdown by year of registration. Detailed data for several larger offices, such as those of Brazil, China, France, Italy and Japan, are not available.

Source: WIPO Statistics Database, September 2017.

**Figure B40**  
**Average age of trademarks in force at selected offices**

Note: BOIP is the Benelux Office for Intellectual Property, and EUIPO is the European Union Intellectual Property Office.

# Trademark application processing

**Figure B41**

**Average number of days between the filing of an application and its recording as a registration for selected offices, 2016**

Note: EUIPO is the European Union Intellectual Property Office. WIPO collects data from IP offices using a common questionnaire and methodology. However, due to differences in application processing procedures between offices, data cannot be fully harmonized. Therefore, one should exercise caution when making comparisons across offices.

# Trademark applications and registrations through the Madrid System

**Figure B42**  
Trend in Madrid international applications

Source: WIPO Statistics Database, September 2017.

**Figure B43**  
Madrid international applications by origin, 2016

Note: Counts are based on the country of the applicant's address, not the office of origin.

Source: WIPO Statistics Database, September 2017.

**Figure B44**  
**Madrid applications for the top 20 origins, 2016**

Note: Origin data are based on the country of the applicant's address.

Source: WIPO Statistics Database, September 2017.

**Figure B45**  
**Trend in non-resident filing activity by filing route (direct and Madrid)**

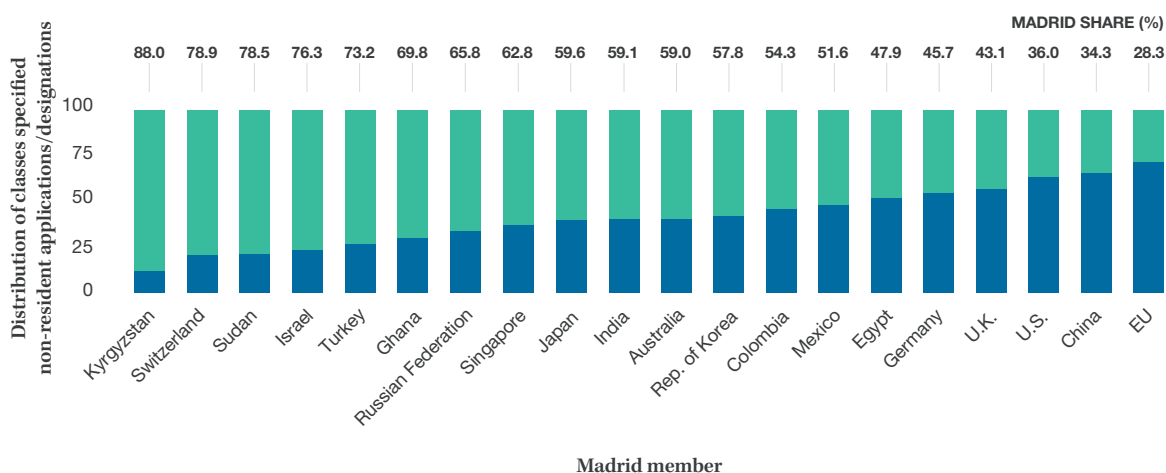

■ DIRECT ■ MADRID

Note: The direct route refers to classes specified in applications filed by non-residents of Madrid member origins directly with national or regional IP offices of Madrid members. This is also referred to as the "Paris route". The Madrid route refers to classes specified in designations received by offices via the Madrid System.

Source: WIPO Statistics Database, September 2017.

**Figure B46**  
**Madrid share of non-resident filing activity for selected designated Madrid members, 2016**

■ CLASSES SPECIFIED IN DIRECT APPLICATIONS   ■ CLASSES SPECIFIED IN MADRID DESIGNATIONS

Note: EU indicates trademark activity occurring at the European Union Intellectual Property Office (EUIPO) and not within the IP offices of individual EU member states. The direct route refers to classes specified in applications filed only by non-residents of all origins – irrespective of Madrid membership – directly with the Madrid member office. The Madrid route refers to classes specified in designations received by the Madrid member office.

a. Data on application class count by origin are incomplete, because some offices do not report detailed statistics containing the origin of application class counts.

b. 2015 data are reported for application class count by office.

c. 2015 data are reported for application class count by origin.

d. Only Madrid designation data are available, so application class count by office and origin data may be incomplete.

e. This country does not have a national trademark office. All applications for trademark protection are filed at the Benelux Office for Intellectual Property or the European Union Intellectual Property Office.

f. Resident applications include those filed by residents of Belgium, Luxembourg and the Netherlands.

g. Resident applications include those filed by residents of EU member states.

h. Origin is defined as the country/territory of the stated residence of the applicant in an international application.

i. Total includes an aggregate direct application class count that cannot be broken down into direct and non-resident components.

j. The African Intellectual Property Office (OAPI) is the competent office for processing applications.

k. Totals are estimated for application class counts by office and origin.

n.a. indicates not applicable.

.. indicates not available.

# Industrial designs

## Highlights

### *Applications are approaching the 1 million mark*

An estimated 963,100 applications were filed worldwide in 2016, representing annual growth of 10.4%. This was the second consecutive year of growth in filings worldwide, following a 10.2% drop in 2014 (figure 15). Increased filings in China accounted for 90% of the total growth in 2016.

The design count worldwide doubled between 2005 and 2016. As was the case with industrial design applications, the number of designs contained in applications (design count) increased sharply, rising 8.3% to reach a total of 1.24 million (figure 16).

## Figure 15 Industrial design applications worldwide

Source: Standard figure C1.

## Figure 16 Number of designs in industrial design applications worldwide

Source: Standard figure C2.

### *More than half of all designs were contained in applications filed at China's office*

The State Intellectual Property Office of China (SIPO) received applications containing 52% of all designs in applications filed worldwide in 2016. The application design count at SIPO grew by 14.3% on the previous year to reach 650,344 designs – a particularly notable surge after almost zero growth in 2013 and 2015, and a 14.4% drop in 2014. Nonetheless, the 2016 volume remained slightly below the figure for 2012 four years earlier. SIPO was followed by the European Union Intellectual Property Office (EUIPO; 104,522), the Korean Intellectual Property Office (KIPO; 69,120), and the offices of Germany (56,188) and Turkey (46,305) (figure 17).

The top 20 offices combined accounted for 93% of designs in all applications. Of these, 14 saw increases in their application design count.<sup>1</sup> The offices of the Islamic Republic of Iran (+34.8%), Ukraine (+17.4%), China (+14.3%) and the United States of America (U.S.; +12.1%) saw double-digit growth, while those of the Russian Federation (+9.4%), the EUIPO (+6.5%), Canada (+5.5%) and France (+5.4%) likewise

experienced notable increases. Of the four offices that received fewer designs in applications, those of Switzerland (-9.1%) and the Republic of Korea (-4.6%) saw significant decreases.

Among those offices located in low- and middle-income countries, annual growth in 2016 was particularly high in Guatemala (+70.4%), the Philippines (+42.2%) and Belarus (+41.9%). The offices of Pakistan, South Africa and Viet Nam saw double-digit growth of between 12% and 18%.

Designs contained in resident applications accounted for 89.3% of the world total design count in 2016. This represented at least one-third of all designs in applications at each of the top 20 offices, with the exception

of the office of Canada (14.8%). The offices with the highest resident design count shares were those of the Islamic Republic of Iran (98.9%), Italy (98.6%) and China (97.2%).

An increase in the number of designs contained in resident applications had a positive impact on the overall annual growth rates of 12 of the top 20 offices and was the primary driver of growth at six of them, making a particularly high contribution in China and Ukraine. Increasing resident and non-resident design counts contributed almost equally to overall growth at the office of the Russian Federation. An increase in the non-resident design count was the main or sole driver of growth at the offices of Australia, India, Japan and the U.S.

## Design count

Some offices allow industrial design applications to contain more than one design for the same good or in the same class; others allow only one design per application. To capture the differences in application filing systems across offices, one needs to compare their respective application and registration design counts.

**Figure 17**  
Application design counts for the top 10 offices, 2016

■ RESIDENT ■ NON-RESIDENT

Source: Standard figure C10.

## Equivalent design count

Designs in applications filed at regional offices are equivalent to multiple designs in applications filed in the respective member states of those offices. To calculate the number of equivalent designs for the African Intellectual Property Organization (OAPI, which has 17 member states), the Benelux Office for Intellectual Property BOIP, (3) and the EUIPO (28), each design is multiplied by the corresponding number of member states. However, the African Regional Intellectual Property Organization (ARIPO) does not register industrial designs with automatic region-wide applicability. Therefore, for this office, each application is counted as one application abroad if the applicant does not reside in a member state or as one resident application and one application abroad if the applicant resides in a member state.

The offices of all upper middle-income countries combined received 60.5% of all designs contained in applications filed in 2016 (figure 18). China accounted for the vast majority of this share, with the other upper middle-income countries generating only 8.1% of the world total. The share of the high-income countries stood at 35.5%. Offices of lower middle-income countries received 3.8% of the total, and those of low-income countries only 0.2%.

Between 2006 and 2016, average annual growth in design counts was 12.4% for China and 3.6% for the other upper middle-income countries combined. Over the same period, offices in high-income (+1.6%) and

lower middle-income (+1.7%) economies had much lower growth rates in comparison, while those of low-income (-4.5%) countries decreased sharply.

Asia accounted for more than two-thirds (69.3%) of all designs in applications filed worldwide in 2016 (figure 19). It was followed by Europe (23.2%) and North America (4.1%). Of all geographical regions, only Asia (+9%), North America (+5.3%) and Europe (+1.3%) experienced average annual growth between 2006 and 2016. In contrast, Oceania (0%), Africa (-0.3%) and Latin America and the Caribbean (LAC; -0.3%) had zero or negative average annual growth rates.

Source: Standard figure C8.

## Industrial design applications filed since 1883

Between 1883 and the early 1950s, the Japan Patent Office (JPO) and the United States Patent and Trademark Office (USPTO) averaged similar numbers of applications, rarely exceeding 10,000. The JPO received the largest number of applications from the 1950s to the late 1990s, reaching approximately 50,000 annual filings at its peak. SIPO began receiving applications in 1985 and saw unprecedented growth, from 640 in 1985 to 660,000 in 2013. It experienced its first and unique drop in 2014. KIPO surpassed the JPO in 2004, and has remained the second-largest office since then. In 2012, the USPTO moved ahead of the JPO to become the third largest. The fifth-largest office is the EUIPO, which began receiving applications in 2003. Unlike the other four offices, the EUIPO has a multiple design system. Applications filed at the EUIPO contained 104,522 designs in 2016.

### Trend in industrial design applications for the top five offices

Source: Standard figure C9.

### Applicants from China reinforce their top position in filings

Applications received by offices from resident and non-resident applicants are referred to as office data, whereas applications filed by applicants at a national/regional office (resident applications) or at foreign offices (applications abroad) are referred to as origin data. Here, industrial design statistics based on the origin of the residence of the first named applicant are reported in order to complement the picture of industrial design activity worldwide.

Applicants from China had the highest equivalent design count in 2016, numbering almost 800,000 (map 3). They were followed by applicants residing in Germany (636,395), Italy (364,944), the U.S. (320,395) and France (213,873). Equivalent designs in applications filed abroad accounted for between

89% and 93% of the total for applicants from all of these countries except for those from China, whose designs in applications filed in China accounted for 80% of the total.

Equivalent design counts increased for 15 origins in 2016, nine of which saw double-digit growth. The sharpest increases came from applicants residing in the Netherlands (+34.1%) and Spain (+20.5%). In contrast, applicants from both Switzerland (-24%) and the Czech Republic (-23.2%) saw sharp decreases in their equivalent design count.

European origins dominate the top 20 origins with 14 countries, followed by five located in Asia and one in North America. In terms of income categories, 18 of the top 20 origins belong to the high-income group, while two upper middle-income countries – China and Turkey – also feature.

Applicants from Germany (569,764), Italy (326,428) and the U.S. (295,965) had the highest number of equivalent designs in applications filed abroad in 2016, and each had growth of between 11% and 20% compared with the previous year. Among the top 10 origins of equivalent designs in applications filed abroad, applicants from Switzerland (-24%) and China (-10.5%) saw the most pronounced declines.

***The Republic of Korea tops the ranking when adjusting for GDP and population***

The Republic of Korea (3,493) had the highest resident design count per 100 billion US dollars (USD) of gross domestic product (GDP) in 2016 (figure 20). It was followed by China (3,183) and Turkey (2,093). Japan (505) and Mongolia (907) were the two other countries in Asia to rank among the top 20. For Africa, only Morocco (1,559) is listed, ranking seventh. The

14 remaining countries were all located in Europe. In this region, the three countries with the highest count per unit of GDP were Italy (1,836), Germany (1,829) and Ukraine (1,647). The gap between the Republic of Korea and China has reduced since 2006, as the resident design count per USD 100 billion GDP decreased by 355 for the Republic of Korea while increasing by 946 for China.

The Republic of Korea (1,222) was also the country with by far the highest resident design count per million population in 2016. It was followed by Germany (806) and Italy (636). Switzerland fell from third position in 2015 to seventh in 2016 with 457 resident designs per million population, due to a 21% annual fall in its resident design count. The top 20 origins in terms of resident design count per million population comprised countries located in Asia and Europe, and these mostly in the high-income category.

### *Furnishing and articles of clothing were the most recorded classes*

The Locarno classification includes 32 classes of industrial designs. In 2016, the classes that accounted for the largest shares of the world total remained furnishings (10.8%), articles of clothing (8.6%) and packages and containers (7.3%). More than a quarter (26.7%) of all designs in applications belonged to one of these three classes.

Grouping the Locarno classes into 12 industry sectors highlights the most important sectors for industrial design in each country. For most of the top 10 offices for which data were available, industrial design filing was concentrated in just three sectors, although these top three sectors varied from office to office. For example, textiles and accessories was the main sector at the EUIPO and the offices of Germany, India and the Republic of Korea, while furniture and household goods accounted for the largest share in Australia, the Islamic Republic of Iran, Turkey and the U.K.

In 10 of the top 15 countries of origin, the majority of designs in applications were filed among their top three sectors, with applicants residing in Austria (75.5%) and Switzerland (72.4%) recording the highest level of concentration among their top three sectors. The furniture and household sector was among the top three sectors for 12 of the top origins, whereas textiles and accessories featured in the top three for 10 of them.

### *Industrial design registrations worldwide fell mainly due to a big drop in China*

An estimated 706,300 industrial designs were registered worldwide in 2016. This represents an annual decline of 3.5% following a pronounced 21.5% increase in 2015. This fall was mainly due to a considerable decrease in registrations in China, which registered 36,524 fewer applications than in 2015. The decline in registrations in China may in part be a result of a sharp decrease in filings (-14.4%) observed there in 2014. Nonetheless, registrations in China accounted for 63% of the world total in 2016.

About 974,000 designs were contained in applications registered in 2016, down 2.1% on 2015. China accounted for 46% of all designs in applications registered worldwide, and the top 20 offices combined comprised 91% of the total. Among these offices, eight saw annual growth, including Brazil (+112.2%), the Islamic Republic of Iran (+23.5%), Morocco (+18.3%) and the U.S. (+13.6%). In contrast, the offices of the Russian Federation (-36.2%), Switzerland (-9.7%), China (-7.6%), Spain (-6.3%) and China, Hong Kong SAR (-5.7%) experienced marked decreases.

### ***Industrial design registrations in force shot up to 3.6 million***

A record 3.6 million industrial design registrations were in force worldwide in 2016, up 6% on 2015. The number of registrations in force in China increased by over 120,000 to reach 1.36 million – 36% of the world total. China was followed by the Republic of Korea (338,234), the U.S. (307,018), Japan (250,819) and the EUIPO (194,781). Four of these top five offices saw growth of between 4.6% for the U.S. and 9.7% for China. In contrast, Japan saw a slight decrease of 0.1%.

### ***Hague filings grew by 36%***

The Hague System offers applicants an advantageous way to seek industrial design protection internationally as an alternative to using the Paris Convention for the Protection of Industrial Property. For further information and statistics on this System, see the *Hague Yearly Review 2017*.

In 2016, the Hague System received 5,562 international applications, up 35.6% on 2015. These applications contained 18,716 designs, representing annual growth of 13.9%. It was the second consecutive year of strong growth, reflecting the recent expansion of the Hague System to include Japan, the Republic of Korea and the U.S.

Applicants residing in Germany remained the largest users of the Hague System with 3,917 designs in applications. They were followed by those residing in Switzerland (2,555), the Republic of Korea (1,882), the U.S. (1,410) and the Netherlands (1,317). Combined, these five origins accounted for nearly 60% of the total. All five experienced double-digit growth in filings except for Switzerland, where they fell by 22.9%. Among the top 20 origins, the strongest growth was among applicants from Cyprus (+138.4%), Turkey (+136.5%) and Japan (+109.2%).

The European Union (EU) has received the largest number of designs contained in designations each year since 2010. In 2016, it recorded 14,952 designs. It was followed by Switzerland (8,811), Turkey (6,137), the U.S. (4,722) and Norway (3,324). Four of the top 20 designated Hague members recorded double-digit annual growth, the highest two being France (+45.9%) and the EU (+12%).

The Hague System accounted for 15.8% of all designs contained in non-resident applications filed worldwide. When considering only non-resident applications filed at offices of Hague members, this share rises to 48%, a decrease of 6 percentage points since 2015. This change in share was due to the inclusion of Japan and the U.S. – two new Hague members – in the calculation.

# Industrial design applications and registrations by office

**Figure C7**

## Application design counts by income group

Income group	Number of designs in applications		Resident share (%)		Share of world total (%)		Average growth (%)
	2006	2016	2006	2016	2006	2016	2006-16
High-income	374,600	440,500	72.8	73.1	54.4	35.5	1.6
Upper middle-income	271,800	751,000	86.8	93.8	39.4	60.5	10.7
...Upper middle-income without China	70,500	100,700	67.8	72.2	10.2	8.1	3.6
Lower middle-income	40,000	47,400	48.3	61.2	5.8	3.8	1.7
Low-income	2,700	1,700	30.1	42.1	0.4	0.2	-4.5
<b>World</b>	<b>689,100</b>	<b>1,240,600</b>	<b>76.7</b>	<b>85.2</b>	<b>100.0</b>	<b>100.0</b>	<b>6.1</b>

Note: Totals by income group are WIPO estimates using data covering 151 IP offices. Each category includes the following number of offices: high-income (57), upper middle-income (43), lower middle-income (37) and low-income (14). Data for the European Union Intellectual Property Office are allocated to the high-income group because most EU member states are high-income countries. For similar reasons, data for the African Regional Intellectual Property Organization and the African Intellectual Property Organization are allocated to the low-income group. For information on income group classification, see the Data description section.

## Application design counts by region

Region	Number of designs in applications		Resident share (%)		Share of world total (%)		Average growth (%)
	2006	2016	2006	2016	2006	2016	2006-16
Africa	18,200	17,700	44.5	59.0	2.7	1.5	-0.3
Asia	362,000	859,700	88.4	92.8	52.5	69.3	9.0
Europe	254,300	288,400	68.9	73.5	36.9	23.2	1.3
Latin America & the Caribbean	15,500	15,000	41.0	49.7	2.2	1.2	-0.3
North America	30,400	51,100	48.9	49.6	4.4	4.1	5.3
Oceania	8,700	8,700	47.1	35.6	1.3	0.7	0.0
<b>Total</b>	<b>689,100</b>	<b>1,240,600</b>	<b>76.7</b>	<b>85.2</b>	<b>100.0</b>	<b>100.0</b>	<b>6.1</b>

Note: Totals by geographical region are WIPO estimates using data covering 151 IP offices. Each region includes the following number of offices: Africa (29), Asia (41), Europe (46), Latin America & the Caribbean (28), North America (2) and Oceania (5). For information on geographical region classification, see the Data description section.

**Contribution of resident and non-resident application design counts to total growth for the top 20 offices, 2015-16**

■ CONTRIBUTION OF RESIDENT APPLICATION DESIGN COUNT  
 ■ CONTRIBUTION OF NON-RESIDENT APPLICATION DESIGN COUNT

.. indicates not available.

Note: EUIPO is the European Union Intellectual Property Office. This figure shows total growth in application design counts broken down by the respective contributions of resident and non-resident filings. For example, design counts in Spain grew by 2.6%, and resident applicants contributed 1.8 percentage points to this total growth. The 2015 data for resident and non-resident breakdown were not available for the office of the Islamic Republic of Iran.

# Application design counts by origin

**Figure C16**

**Equivalent application design counts by origin, 2016**

Note: Equivalent application design count includes resident applications and applications filed abroad. The origin of an industrial design application is determined by the residence of the first named applicant. Applications filed at some regional offices are considered equivalent to multiple applications in the member states of those offices. See the glossary for the full definition of equivalent application.

Source: WIPO Statistics Database, September 2017.

**Figure C17**

**Application design counts for the top 20 origins, 2016**

.. indicates not available.

Note: Data are based on absolute count, not equivalent count. The origin of an industrial design application is determined by the residence of the first named applicant. An application filed at a regional office is considered a resident filing if the applicant is a resident of one of that office's member states. See the glossary for the definition of absolute applications.

a. Design count by origin is incomplete, as some offices do not report the origin of applications.

b. 2015 data are reported for application design count by office.

c. 2015 data are reported for application design count by origin.

d. Only Hague designation data are available and/or the office has not reported the origin of applications, so design count by office and origin data may be incomplete.

e. Origin is defined as the country of the stated address of residence of the applicant in an international application.

f. The African Intellectual Property Organization (OAPI) is the competent office for processing applications.

g. Totals are estimated for application design counts by office and origin.

# Plant varieties

## Highlights

### *Plant variety applications grew at their fastest rate in 15 years*

Around 16,510 plant variety applications were filed worldwide in 2016, up 8.3% on 2015 – the largest increase in applications in 15 years (figure 21). The offices of China, the Republic of Korea, Ukraine and the Community Plant Variety Office (CPVO) of the European Union (EU) accounted for most of this growth.

## Figure 21 Plant variety applications worldwide

Source: Standard figure D1.

### *Offices with the most plant variety filings*

The CPVO remained the top filing office in 2016, receiving 3,299 applications. China was second with 2,923, followed by the United States of America (U.S.; 1,604), Ukraine (1,274) and Japan (977) (figure 22).<sup>1</sup> Among these top five offices, China (+24.8%), the CPVO (+6.0%), Japan (+6.9%) and Ukraine (+18.5%) experienced growth, while the U.S. (-1.8%) was the only top-five office to experience a decline. Growth in China and at the CPVO was driven by resident filings, whereas a large increase in non-resident filings drove growth in Ukraine. The decline in filings in the U.S. was caused by a decrease in resident filings which outweighed a year-on-year increase in non-resident filings.

The combined share of applications received at the top five offices worldwide increased marginally, from around 60% in 2015 to 61% in 2016, due to the growth experienced by China and Ukraine.

Eight of the top 10 offices received more applications from residents than from non-residents. Among these offices, China's resident share (91.9%) was the highest. In contrast, Australia and Ukraine received more than half their filings from non-resident applicants.

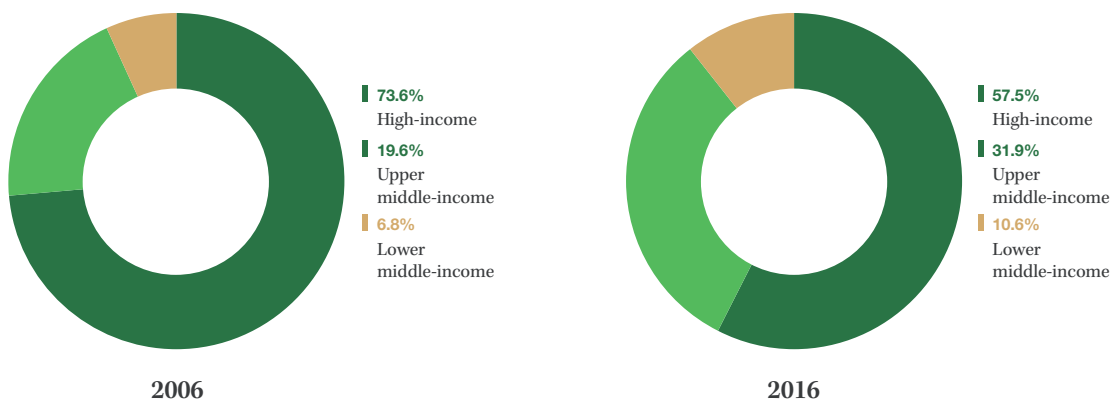

Offices of high-income economies accounted for the largest proportion (57.5%) of plant variety applications received in 2016, but this was down from 73.6% a decade earlier in 2006 (figure 23). Offices in the upper middle-income group, however, saw their combined share increase from 19.6% in 2006 to 31.9% in 2016, mostly driven by the increase in filings in China. The share held by the lower middle-income group likewise increased, from 6.8% in 2006 to 10.6% in 2016.

**Figure 23**  
**Plant variety applications by income group**

Source: Standard figure D3.

Offices in Europe received 42.1% of all plant variety applications in 2016, somewhat less than their share a decade earlier (46.6%) (figure 24). Asia saw its share increase from 22.9% in 2006 to 32.6% in

2016 at the expense of a drop of 4.6 percentage points in North America. Shares for Latin America and the Caribbean (LAC; 7.7%), Africa (3.1%) and Oceania (3.1%) were largely unchanged.

***Applicants from the Netherlands filed the most worldwide***

Applications received by offices from resident and non-resident applicants are referred to as office data, whereas applications filed by applicants at a national/regional office (resident applications) or at a foreign office (applications abroad) are referred to as origin data. Here, plant variety statistics based on the origin of residence are reported in order to complement the picture of activity worldwide. Note that for applicants domiciled in EU member states, filing at the CPVO regional office is also regarded as a resident filing.

Applicants from the Netherlands remained the most active applicants in the world in 2016, filing 3,129 plant variety applications at various offices.

They were followed by applicants from China, who filed 2,720 applications. The U.S. (2,035), France (1,050) and Germany (934) were the third, fourth and fifth largest origins, respectively. Among the top five origins, China (+29.5%) and the Netherlands (+15%) experienced the largest annual growth in filings. France (+1.2%) and the U.S. (+0.4%) also saw modest growth, while Germany declined slightly by 0.8%.

While applicants from four of the top five origins filed most of their applications abroad or at the regional office, only those from China filed almost exclusively at home. Similarly, applicants from Japan, the Republic of Korea, the Russian Federation and Ukraine also filed predominantly at their home offices, reflecting lower interest in seeking protection internationally.

## Equivalent count

Origin data are compiled using two different counting methods – absolute counts and equivalent counts. The difference between the two lies in the treatment of regional office (CPVO) data. For absolute counts, an application received by the CPVO is counted only once. For the equivalent count, a single application filed at the CPVO is equivalent to multiple applications. To calculate the number of equivalent applications at the CPVO in 2016, each application has been multiplied by the corresponding number of member states. If the applicant resided in one of the 28 EU member states, the application was counted as one resident filing and 27 filings abroad. If the applicant did not reside in an EU member state, the application was counted as 28 filings abroad.

Equivalent counts take multiple members of the regional office into account. One would expect to see those country origins whose applicants filed intensively at the CPVO move up the ranking when this counting method is applied. Not surprisingly, European countries and the U.S. topped the list of origins based on equivalent counts. Applicants from the Netherlands remained number one, with 37,716

equivalent applications filed worldwide. They were followed by applicants from France (13,659), Germany (11,599) and the U.S. (10,463). China (3,000) was the only other non-European country among the top 10 origins despite the fact that only 10% of its applicants' filings were equivalent filings abroad. This is in marked contrast to the Netherlands, for which the share was 95%.

## Map 4

Source: Standard figure D9.

### *The number of titles issued increased for the fourth consecutive year*

The total number of plant variety titles issued rose by 5.2% in 2016 to reach 13,280 (figure 25). China accounted for most of this growth, with titles issued increasing by 34.2%. However, the CPVO issued the largest number of titles (2,980). China (2,132) issued the second most titles, overtaking the U.S. (1,703). They were followed by Japan (941) and the Republic of Korea (834). Together with China, other offices that saw large increases in titles issued were the Republic of Korea (+34.7%), Canada (+26.5%), Brazil (+13.2%) and Japan (+11.1%). The Netherlands (-4.1%) was the only office among the top 10 to issue fewer titles in 2016 than in 2015.

The grant or registration process takes time, so fluctuations in volumes of granted plant variety titles may reflect changes in processing capacities or procedural delays.

### *Steady growth in plant varieties in force*

Around 116,540 plant variety titles were in force at the end of 2016, up 4.8% on 2015. The CPVO (25,148) and the U.S. (24,375) were the two offices with the highest numbers of active titles. Other offices maintaining at least 4,000 active titles included Japan (8,339), the Netherlands (7,937), China (6,781), the Republic of Korea (4,801) and the Russian Federation (4,739).

**Figure D7**  
**Plant variety applications for offices of selected low- and middle-income countries, 2016**

Note: The selected offices are from different world regions and income groups. Where available, data for all offices are in the statistical table at the end of this section.

Source: WIPO Statistics Database, September 2017.

**Figure D8**  
**Plant variety titles issued by the top 20 offices, 2016**

Note: CPVO is the Community Plant Variety Office. The procedure for issuing titles varies across offices, and differences in the numbers of titles issued between offices depend on factors such as examination capacity and procedural delays, so there is a time lag between application and title issue dates. For this reason, data on applications for a given year should not be compared with data on titles issued for the same year.

# Geographical indications

At present, there is a notable lack of global statistics on geographical indications (GIs).<sup>1</sup> The collection of reliable GI statistics could enable researchers to conduct empirical research and promote evidence-based policymaking.

In 2016, WIPO initiated a survey to collect GI data and invited national and regional intellectual property (IP) offices and/or other competent authorities to share these data. A pilot survey for reference year 2015 was launched in 2016. Based on the response rate and inputs received from respondents, the questionnaires were revised and sent to national/regional authorities in 2017 inviting them to share their 2016 GI data with WIPO. In response, 54 national/regional authorities provided their data to WIPO in 2017.

It is important to note that responsibility for protecting GIs is often shared among different authorities within a country. This can make it challenging to obtain a complete picture of all GIs protected in any particular country. WIPO has made substantial efforts to gather data from all sources, but in many instances it has not been possible to obtain data from every source. Therefore, caution should be exercised when interpreting the GI data here presented. Notwithstanding data limitations, this is the first time WIPO has reported GI data covering a large number of countries. We encourage countries unable to share their GI data with us to provide relevant statistics in the near future.

## *What is a geographical indication?*

A GI is a sign identifying a good as originating in a specific geographical area and possessing a given quality, reputation or other characteristic that is *essentially attributable* to that geographical origin. Thus, the main function of a GI is to indicate a connection between that quality, characteristics or reputation of the good and its territory of origin.

World-renowned examples of GIs include Café de Colombia (Colombia), Bordeaux (France), Kampot Pepper (Cambodia), Penja Pepper (Cameroon) and Scotch whisky (UK).

GIs are mainly used for agricultural and food products, which typically tend to have a close natural link with their place of origin. There are, however, also many GIs for other kinds of products. The specific qualities of the product may derive from traditional manufacturing skills or from a combi-

nation of local know-how and natural resources. Examples of such GIs include Bohemia Crystal (Czech Republic), Solingen Cutlery (Germany), Kilim Carpets (Turkey), Swiss Watches (Switzerland) and Yangzhou Lacquerware (China).

Although GIs are commonly names of places, under many systems they may consist of non-geographical terms with a traditional geographical connotation. Reblochon (France) and Argan oil (Morocco) serve as GIs although they are not geographical names.

Geographical indications can only be used by producers, whose goods conform to the applicable requirements concerning the area of origin, processing method and typicality of the product. Production sites located outside the area of origin and goods that do not meet the applicable requirements are prevented from using the protected indication.

## *What is an appellation of origin?*

An appellation of origin (AO) is a special kind of geographical indication. It generally consists of a geographical name or a traditional denomination which serves to designate a product as originating therein, where the quality or characteristics of the product are due *exclusively or essentially* to the geographical environment, including natural and human factors, and which have given the good its reputation. The most important difference between AOs and other GIs is that the link with the place of origin should be stronger in the case of an AO. In other words, AOs are a more restrictive sub-category of GIs.

## *How are GIs protected?*

At the national and regional levels, GIs are protected through a variety of legal means. These include *sui generis* systems – laws specifically designed to protect geographical indications,<sup>2</sup> often based on a registration procedure. *Sui generis* systems generally provide protection against any direct and indirect commercial use of the GI as well as against its imitation. *Sui generis* systems for GI protection are used in many countries and also by two regional intergovernmental organizations: the African Intellectual Property Organization (OAPI) and the European Union (EU).

GIs are also protected on the basis of trademark law, commonly through the use of collective and certification marks. Because trademarks incorporating geographi-

cal terms are typically not recorded by IP offices as a separate category of trademarks, and because not all trademarks incorporating geographical terms can be considered GIs, it may be difficult to determine the exact number of registered GIs within those jurisdictions. It is also worth noting that GI protection via trademark and *sui generis* systems are not mutually exclusive but often coexist, under many legal frameworks, and are available to the benefit of GI holders.

Finally, GIs are typically also protected under unfair competition and consumer protection laws and administrative and judicial decisions as well as under specific laws or decrees recognizing individual GIs.

The effects of a GI right obtained in a particular jurisdiction are limited to the territory of that jurisdiction. Thus, where a right over a GI is obtained in one jurisdiction, it is protected there but not abroad. In order to obtain protection in a foreign jurisdiction, GI holders must, in principle, seek protection under the relevant national laws prevailing in the jurisdiction in question. However, international agreements can facilitate the acquisition of GI rights abroad. In particular, many bilateral and regional trade agreements have incorporated lists of GIs that are to be protected in the relevant parties to the agreement. The listed GIs may relate to existing or subsequent registrations of GI rights, but protection may also emanate from the trade agreements themselves.

Another way of obtaining GI protection abroad is through two international registration systems administered by WIPO: the Lisbon System and the Madrid System.

### *The Lisbon System*

The Lisbon System was established in 1958 to facilitate the international protection of appellations of origin through a single registration procedure.<sup>3</sup> Registration with the WIPO International Bureau ensures protection in all Lisbon contracting parties, without need for renewal and as long as the appellation of origin remains protected in its contracting party of origin. However, the decision whether to protect a newly registered appellation of origin at the national level remains the prerogative of each

contracting party, and each Lisbon member can refuse protection based on any ground within one year of being notified of a new appellation of origin by the WIPO International Bureau. The Lisbon System is flexible as regards the means by which countries may provide protection for the registered appellation of origin (e.g., *sui generis* systems, trademark laws or specific ad hoc decrees as well as judicial and administrative decisions).

Globally-renowned examples of appellations of origin protected under the Lisbon System include Tequila (Mexico), Chianti for wines (Italy), Habanos for cigars (Cuba) and handicrafts such as Chulucanas for ceramics (Peru), Herend for porcelain (Hungary) and Kraslice musical instruments (Czech Republic). The scope of the System extends to non-geographical traditional names such as Reblochon (France) and Vinho Verde (Portugal).

In 2015, with the adoption of the Geneva Act of the Lisbon Agreement on Appellations of Origin and Geographical Indications, which will enter into force after five ratifications or accessions, Lisbon contracting parties modernized the System to attract a wider membership, while preserving its principles and objectives. The Geneva Act formally extends the scope of the Lisbon System to the general category of geographical indications in addition to appellations of origin. The new Act also opens the Lisbon System to accession by intergovernmental organizations such as the EU and OAPI.

### *The Madrid System*

GIs can also be protected in several countries as collective and certification marks through the Madrid System, an international registration system legally governed by the Madrid Agreement (1891) and the Madrid Protocol (1989) and administered by WIPO.<sup>4</sup> Famous examples of collective and certification marks registered under the Madrid System include Napa Valley for wine (U.S.) and Parmigiano Reggiano for cheese (Italy). As at June 2017, there were more than 1,200 collective and certification marks registered under the Madrid System. However, collective and certification marks protecting GIs are not separately recorded, so it is difficult to determine their exact number.

### How many GIs are in force worldwide?

Data received from the 54 national/regional authorities that shared their data with WIPO (figure 29) reveals the existence of approximately 42,527 protected GIs. Approximately 49% of these were in force domestically and the remaining 51% in foreign jurisdictions (figure 26). Germany had the largest number of GIs in force (9,499), followed by China (7,566), the EU (4,914), the Republic of Moldova (3,442) and Bosnia and Herzegovina (3,147). The top five authorities accounted for 67% of the 2016 total (figure 27).

These figures should be interpreted with caution, however. Not only are the data limited to the 54 countries that shared their data with WIPO, but the submissions made by many countries were incomplete. The questionnaire underlying the data collection asked for information regarding GIs protected through *sui generis* systems, the trademark system and trade agreements. As can be seen from figure 29, many countries were unable to provide statistics on the number of GIs protected through the trademark system, reflecting the difficulty of identifying such GIs among all collective and certification trade-

marks registered. In addition, several countries could not provide data on the number of GIs protected through trade agreements. Finally, there is likely to be double-counting of GIs protected through two or more legal means.<sup>5</sup>

**Figure 28**  
**Appellations of origin in force by origin, 2016**

Source: WIPO Statistics Database, September 2017.

### *Use of the Lisbon System to protect appellations of origin*

The Lisbon System consists of 28 member countries, many of which are European. In 2016, there were 956 appellations of origin in force via the Lisbon System (figure 28). France accounted for 53.2% of this total, followed by Italy (14.9%), the Czech Republic (7.9%) and Bulgaria (5.3%).

### *Conclusions*

This is the first time WIPO has compiled and reported GI data covering a large number of national/regional authorities. Although the data are incomplete and partial, this

initiative should be seen as an initial step in creating more comprehensive and accurate data sets regarding GIs.

WIPO will continue to collect these data and it is hoped that data coverage will improve over time.

We are grateful to all those authorities that shared their data, and encourage authorities unable to share their data at present to make efforts to share them in the future.

# Additional information

## Data description

### *Data sources*

Intellectual property (IP) data are taken from the WIPO Statistics Database and are based primarily on WIPO's annual IP statistics survey (see below) and on data compiled by WIPO in processing international applications/registrations through the Patent Cooperation Treaty (PCT) and the Madrid and Hague Systems.

Data are available from WIPO's Statistics Data Center at [www.wipo.int/ipstats](http://www.wipo.int/ipstats).

Patent family and technology data are extracted from the WIPO Statistics Database and from the 2017 autumn edition of the European Patent Office's PATSTAT database.

Gross domestic product and population data are from the World Bank's World Development Indicators database.

This report uses the World Bank's income classifications. Economies are classified according to 2016 gross national income per capita as calculated using the World Bank Atlas method. The classifications are low-income (USD 1,005 or less), lower middle-income (USD 1,006 to USD 3,955), upper middle-income (USD 3,956 to USD 12,235) and high-income (over USD 12,235).

This report uses United Nations (UN) definitions of regions and sub-regions, although the geographical terms used in the report may differ slightly from those defined by the UN.

### *WIPO's annual IP statistics survey*

WIPO collects data from national and regional IP offices around the world through an annual survey

consisting of multiple questionnaires, and enters these data into the WIPO Statistics Database. When possible, data published on IP offices' websites or in annual reports are used to supplement questionnaire responses in cases where IP offices do not provide statistics. Efforts are ongoing to improve the quality and availability of IP statistics, and to gather data for as many IP offices and countries as possible. The questionnaires are available in English, French and Spanish at [www.wipo.int/ipstats/en/data\\_collection/questionnaire](http://www.wipo.int/ipstats/en/data_collection/questionnaire).

In addition to its regular IP survey covering patents, utility models, trademarks, industrial designs and plant varieties, WIPO launched a new survey in 2017 to collect data on geographical indications. Around 54 national and regional authorities shared their 2016 data on geographical indications in force with WIPO. Furthermore, WIPO also launched a new questionnaire to compile patent office operations data covering application process times, examination capacity and examination outcome. A large number of IP offices shared operations data with WIPO. The Special section chapter of this report is based on the data collected via this new survey.

Data are broken down by IP office, origin, resident and non-resident applications, applications abroad, class count, design count and other factors. See the glossary for definitions of key concepts used in this publication.

Offices are requested to report data by the origin (country or territory) of applications, grants or registrations. However, some offices are unable to provide a detailed breakdown. Instead, these offices report either an aggregate total or a simple breakdown by total resident and total non-resident. For this reason, the totals for each origin are under-reported. However, the unknown origin shares of the 2016 totals are low – only 1.1% for patent applications, 0.8% for trademark application class counts and 2.7% for application design counts.

**Table 1**  
**IP applications data coverage by IP type**

IP type	Number of offices on which 2016 world totals are based	Number of offices for which 2016 data are available	Data coverage (%)
Patents	154	119	99.2
Utility models	74	62	99.9
Trademarks (a)	166	116	97.7
Industrial designs (b)	151	124	99.8
Plant varieties	68	60	99.7

a. refers to the number of trademark applications based on class count (that is, the number of classes specified in applications).

b. refers to the number of industrial design applications based on design count (that is, the number of designs contained in applications).

### *Estimating world totals*

World totals for applications for, and grants/registrations of, patents, utility models, trademarks, industrial designs and plant varieties are WIPO estimates. Data are not available for all IP offices for every year. Missing data are estimated using methods such as linear extrapolation and averaging adjacent data points. The estimation method used depends on the year and office in question. When an office provides data not broken down by origin, WIPO estimates the resident and non-resident counts using the historical shares of that office. Data are available for most of the larger offices; only small shares of world totals are estimated. For example, the estimate of the total number of patent applications worldwide covers 154 offices. Data are available for 119 of them which account for 99.2% of the estimated world total. Table 1 shows the availability and coverage of data on applications for different types of IP.

### *National and international data*

Application and grant/registration data include data on both direct filings and filings through WIPO-

administered international systems (where applicable). For patents and utility models, data include direct filings at national patent offices as well as PCT national phase entries. For trademarks, data include filings at national and regional offices and designations received by relevant offices through the Madrid System. For industrial designs, data include national and regional applications combined with designations received by relevant offices through the Hague System.

### *International comparability of indicators*

Every effort has been made to compile IP statistics based on the same definitions and to facilitate international comparability. Although data are collected from offices using questionnaires from WIPO's harmonized annual IP survey, national laws and regulations for filing IP applications or for issuing IP rights as well as statistical reporting practices may differ among jurisdictions. Due to continual updating of data and the revision of historical statistics, data in this report may differ from data in previous editions and from data available on WIPO's website.

## IP systems at a glance

### *The patent system*

A patent is a set of exclusive rights granted by law to applicants for an invention that meets the standards of novelty, non-obviousness and industrial applicability. It is valid for a limited period (generally 20 years), during which time the patent holder can commercially exploit the invention on an exclusive basis. In return, applicants are obliged to disclose their inventions to the public, so that others skilled in the art may replicate them. The patent system is designed to encourage innovation by providing innovators with time-limited exclusive legal rights, thus enabling them to appropriate the returns from their innovative activity.

The procedures for acquiring patent rights are governed by the rules and regulations of national and regional patent offices. These offices are responsible for issuing patents, and the rights are limited to the jurisdiction of the issuing authority. To obtain patent rights, applicants must file an application describing the invention with a national or regional office.

Applicants can also file an international application through the Patent Cooperation Treaty (PCT) System, an international treaty administered by WIPO that facilitates the acquisition of patent rights in multiple jurisdictions. The PCT System simplifies the process of multiple national patent filings by delaying the requirement to file a separate application in each jurisdiction in which protection is sought. However, the decision whether to grant a patent remains the prerogative of national or regional patent offices, and patent rights are limited to the jurisdiction of each patent-granting authority.

The PCT application process begins with the international phase, during which an international search and optional preliminary examination and supplementary international search are performed. It concludes with the national phase, during which national (or regional) patent offices decide on the patentability of an invention according to national law. Further information about the PCT System is available at [www.wipo.int/pct](http://www.wipo.int/pct).

### *The utility model system*

Like a patent, a utility model (UM) confers a set of rights to an invention for a limited period, during which the UM holder can commercially exploit their invention on an exclusive basis. The terms and conditions for granting a UM differ from those for granting a traditional patent. For example, UMs are issued for a shorter period (6-10 years), and at most offices protection is granted without substantive examination. As with patents, procedures for granting UM rights are governed by the rules and regulations of national intellectual property (IP) offices, and rights are limited to the jurisdiction of the issuing authority.

Approximately 75 countries provide protection for UMs. In this report, the term “utility model” refers to UMs and other types of protection similar to UMs, such as innovation patents in Australia and short-term patents in Ireland.

### *Microorganisms under the Budapest Treaty*

The Budapest Treaty on the International Recognition of the Deposit of Microorganisms for the Purposes of Patent Procedure plays an important role in relation to biotechnological inventions. Disclosing an invention is a generally recognized requirement for receiving a patent. When an invention involves microorganisms, national laws in most countries require the applicant to deposit a sample at a designated International Depository Authority (IDA).

To eliminate the need to deposit a microorganism in every country in which patent protection is sought, the Budapest Treaty provides that depositing a microorganism with any IDA will suffice for the purposes of patent procedures at national patent offices of all contracting states and at regional patent offices that recognize the treaty. An IDA is a scientific institution – typically a “culture collection” – capable of storing microorganisms. Currently, there are 46 IDAs around the world. Further information about the Budapest Treaty is available at [www.wipo.int/treaties/en/registration/budapest](http://www.wipo.int/treaties/en/registration/budapest).

### *The trademark system*

A trademark is a distinctive sign that identifies certain goods or services as those produced or provided by a specific person or enterprise. Trademarks can be registered for both goods and services. In the latter case, the term “service mark” is sometimes used. For simplicity, this report uses “trademark” regardless of whether the registration concerns goods or services. The holder of a registered trademark has the exclusive right to use the mark in relation to the goods or services for which it is registered, and can block unauthorized use of the trademark, or a confusingly similar mark, to prevent consumers from being misled. Unlike patents, trademark registrations can be maintained indefinitely provided the trademark holder pays the required renewal fees.

The procedures for registering trademarks are governed by the rules and regulations of national and regional IP offices. Therefore, trademark rights are limited to the jurisdiction of the authority in which a trademark is registered. Trademark applicants can file an application with the relevant national or regional IP office or an international application through the Madrid System. However, when an applicant files internationally via the Madrid System, the decision to issue a trademark registration remains the prerogative of the national or regional IP office concerned, and trademark rights remain limited to the jurisdiction of the authority issuing that registration.

The Madrid System is governed legally by the Madrid Agreement (1891) and the Madrid Protocol (1989) and is administered by WIPO. It simplifies multinational trademark registration by allowing an applicant to apply for a trademark in a large number of countries by filing a single application through a national or regional IP office that is party to the System. This eliminates the requirement to file an individual application in each jurisdiction in which protection is sought. The System also simplifies subsequent management of the trademark, since it is possible to centrally request and record further changes, or to renew the registration through a single procedure. A registration recorded in the International Register yields the same effect as a registration made directly with each designated Contracting Party (Madrid member) if no refusal is made by the competent

authority of that jurisdiction within a specified time limit. Further information about the Madrid System is available at [www.wipo.int/madrid](http://www.wipo.int/madrid).

### *The industrial design system*

Industrial designs are applied to a wide variety of industrial products and handicrafts.<sup>1</sup> They refer to the ornamental or aesthetic aspects of a useful article, including compositions of lines or colors or three-dimensional forms that give a special appearance to a product or handicraft. The holder of a registered industrial design has exclusive rights over the design and can prevent unauthorized copying or imitation of the design by others.

The procedures for registering industrial designs are governed by national or regional laws. An industrial design can be protected if it is new or original, and rights are limited to the jurisdiction of the issuing authority. Registrations can be obtained by filing an application with a relevant national or regional IP office or by filing an international application through the Hague System. Once a design is registered, the term of protection is generally five years and may be renewed for additional periods of five years up to a total of 15 years in most cases. In some countries, industrial designs are protected through the delivery of a design patent rather than design registration.

The Hague System comprises two international treaties – the Hague Act and the Geneva Act. The System makes it possible for an applicant to register industrial designs in multiple countries by filing a single application with the International Bureau of WIPO, thus simplifying multinational registration. Moreover, by allowing the filing of up to 100 different designs per application, the System offers considerable opportunities for efficiency gains. It also streamlines the subsequent management of industrial design registration, since it is possible to record changes or renew a registration through a single procedure. Further information about the Hague System is available at [www.wipo.int/hague](http://www.wipo.int/hague).

### *Plant variety protection*

To obtain protection, a plant breeder must file an individual application with each authority entrusted with granting breeders’ rights. A breeder’s right is

granted only when a variety is new, distinct, uniform and stable, and has a suitable denomination.

In the United States of America (U.S.), two legal frameworks protect new plant varieties: the Plant Patent Act (PPA) and the Plant Variety Protection Act (PVPA). Under the PPA, whoever invents or discovers and asexually reproduces any distinct and new variety of plant – including cultivated sports, mutants, hybrids and newly-found seedlings other than a tuber-propagated plant (in practice, Irish potato and Jerusalem artichoke), or a plant found in an uncultivated state – may obtain a patent. Under the PVPA, the U.S. protects all sexually reproduced plant varieties and tuber-propagated plant varieties, excluding fungi and bacteria.

## Glossary

This glossary provides definitions of key technical terms and concepts. Many of these terms are defined generically (for example, “application”) but apply to several or all of the various forms of intellectual property (IP) covered in this report.

### *Applicant*

An individual or other legal entity that files an application for a patent, utility model, trademark or industrial design. There may be more than one applicant in an application. For the statistics in this publication, the name of the first named applicant is used to determine the origin of the application.

### *Application*

The procedure for requesting IP rights at an office which then examines the application and decides whether to grant protection. Also refers to a set of documents submitted to an office by the applicant.

### *Application abroad*

For statistical purposes, an application filed by a resident of a given state or jurisdiction with the IP office of another state or jurisdiction. For example, an application filed by an applicant domiciled in France with the Japan Patent Office (JPO) is considered an application abroad from the perspective of France. This differs from a “non-resident application,” which describes an application

filed by a resident of a foreign state or jurisdiction from the perspective of the office receiving the application: the example above would be a non-resident application from the JPO’s point of view.

### *Application date*

The date on which the IP office receives an application that meets the minimum requirements. Also referred to as the filing date.

### *Budapest Treaty*

Disclosure of an invention is a requirement for granting a patent. Normally, an invention is disclosed by means of a written description. Where an invention involves a microorganism or the use of a microorganism, disclosure is not always possible in writing but can sometimes only be effected by depositing a sample of the microorganism with a specialized institution. To eliminate the need to deposit a microorganism in each country in which patent protection is sought, the Budapest Treaty provides that the deposit of a microorganism with any International Depositary Authority (IDA) suffices for the purposes of patent procedure at the national patent offices of all contracting states and at any regional patent office that recognizes the treaty.

### *Class*

May refer to the classes defined in either the Locarno Classification or the Nice Classification. Classes indicate the categories of products and services (where applicable) for which industrial design or trademark protection is requested. See “Locarno Classification” and “Nice Classification.”

### *Class count*

The number of classes specified in a trademark application or registration. In the international trademark system and at certain national and regional offices, an applicant can file a trademark application that specifies one or more of the 45 goods and services classes of the Nice Classification. Offices use a single- or multi-class filing system. For example, the offices of Japan, the Republic of Korea and the United States of America (U.S.) as well as many European IP offices have multi-class filing systems. The offices of Brazil,

Mexico and South Africa follow a single-class filing system, requiring a separate application for each class in which an applicant seeks trademark protection. To capture the differences in application and registration numbers across offices, it is useful to compare their respective application and registration class counts.

### *Certification trademark*

Certification marks are usually given for compliance with defined standards, but are not confined to any membership. They may be used by anyone who can certify that the products involved meet certain established standards. In many countries, the main difference between collective marks and certification marks is that collective marks may only be used by a specific group of enterprises, for example, members of an association, while certification marks may be used by anybody who complies with the standards defined by the owner of the certification mark.

### *Collective trademark*

Collective marks are usually defined as signs which distinguish the geographical origin, material, mode of manufacture or other common characteristics of goods or services of different enterprises using the collective mark. The owner may be either an association of which those enterprises are members or any other entity, including a public institution or a cooperative.

### *Community Plant Variety Office (CPVO) of the European Union (EU)*

An EU agency that manages a system of plant variety rights covering all EU member states.

### *Design count*

The number of designs contained in an industrial design application or registration. Under the Hague System for the International Registration of Industrial Designs, it is possible for an applicant to obtain protection for up to 100 industrial designs for products belonging to one and the same class by filing a single application. Some national or regional IP offices allow applications to contain more than one design for the same product or within the same class, while others allow only one design per application. In order to capture the differences in

application and registration numbers across offices, it is useful to compare their respective application and registration design counts.

### *Designation*

Designation in an international application or registration means the request by which the applicant/international registration holder specifies the jurisdiction(s) in which they seek to protect their industrial designs (Hague System) or trademarks (Madrid System).

### *Direct filing*

See "National route."

### *Equivalent application*

Applications at regional offices are equivalent to multiple applications, one in each of the states that is a member of those offices. To calculate the number of equivalent applications for the Benelux Office for Intellectual Property (BOIP), the Eurasian Patent Organization (EAPO), the African Intellectual Property Organization (OAPI), the Patent Office of the Cooperation Council for the Arab States of the Gulf (GCC Patent Office) and the European Union Intellectual Property Office (EUIPO), each application is multiplied by the corresponding number of member states. For European Patent Office (EPO) and African Regional Intellectual Property Organization (ARIPO) data, each application is counted as one application abroad if the applicant does not reside in a member state or as one resident and one application abroad if the applicant resides in a member state. The equivalent application concept is used for reporting data by origin.

### *Equivalent grant (registration)*

Grants (registrations) at regional offices are equivalent to multiple grants (registrations), one in each of the states that is a member of those offices. To calculate the number of equivalent grants (registrations) for BOIP, EAPO, the EUIPO, the GCC Patent Office or OAPI, each grant (registration) is multiplied by the corresponding number of member states. For EPO and ARIPO data, each grant is counted as one grant abroad if the applicant does not reside in a member state or as one resident and one grant

abroad if the applicant resides in a member state. The equivalent grant (registration) concept is used for reporting data by origin.

### ***European Patent Office (EPO)***

The EPO is the regional patent office created under the European Patent Convention, in charge of granting European patents for EPC member states. Under Patent Cooperation Treaty (PCT) procedures, the EPO acts as a receiving office, an International Searching Authority and an International Preliminary Examining Authority.

### ***European Union Intellectual Property Office (EUIPO)***

The EUIPO is the office responsible for managing the EU trademark and the registered community design. The validity of these two intellectual property rights extends across the jurisdictions of the EU's 28 member states.

### ***Filing***

See "Application."

### ***Foreign-oriented patent families***

A special subset of patent families that comprises foreign-oriented patent families: this includes only patent families that have at least one filing office different from the office of the applicant's country of origin. Some foreign-related patent families include only one filing office, because applicants may choose to file directly with a foreign office. For example, if a Canadian applicant files a patent application directly with the United States Patent and Trademark Office (USPTO) without previously filing with the patent office of Canada, that application and applications filed subsequently with the USPTO will form a foreign-oriented patent family.

### ***Geographical indication***

A geographical indication (GI) is a sign identifying a good as originating in a specific geographical area and possessing a given quality, reputation or other characteristic that is *essentially attributable* to that geographical origin. Thus, the main function of a GI is to indicate a connection between that quality,

characteristics or reputation of the good and its territory of origin.

### ***Grant***

A set of exclusive rights legally accorded to the applicant when a patent or utility model is granted or issued.

### ***Gross domestic product (GDP)***

The total unduplicated output of economic goods and services produced within a country as measured in monetary terms.

### ***Hague international application***

An application for the international registration of an industrial design filed under the WIPO-administered Hague System.

### ***Hague international registration***

An international registration issued via the Hague System, which facilitates the acquisition of industrial design rights in multiple jurisdictions. An application for international registration of an industrial design leads to its recording in the International Register and the publication of the registration in the *International Designs Bulletin*. If the registration is not refused by the IP office of a designated Hague member, the international registration will have the same effect as a registration made in that jurisdiction.

### ***Hague member (Contracting Party)***

A state or intergovernmental organization that is a member of the Hague System. Includes any state or intergovernmental organization party to the 1999 Act and/or the 1960 Act of the Hague Agreement. Entitlement to file an international application under the Hague Agreement is limited to natural persons or legal entities having a real and effective industrial or commercial establishment, or a domicile, in at least one of the Contracting Parties to the Agreement, or being a national of one of those Contracting Parties or of a member state of an intergovernmental organization that is a Contracting Party. In addition – but only under the 1999 Act – an international application may be filed on the basis of habitual residence in the jurisdiction of a Contracting Party.

***Hague route***

An alternative to the Paris route (i.e., the direct national or regional route), the Hague route enables an application for international registration of industrial designs to be filed using the Hague System.

***Hague System***

The abbreviated form of the Hague System for the International Registration of Industrial Designs. This System comprises two international treaties: the Hague Act of 1960 and the Geneva Act of 1999. The Hague System makes it possible for an applicant to register up to 100 industrial designs in multiple jurisdictions by filing a single application with the International Bureau of WIPO. It simplifies multi national registration by reducing the requirement to file separate applications with each IP office. The System also simplifies the subsequent management of the industrial design, since it is possible to record changes or renew a registration through a single procedural step.

***In force***

Refers to IP rights that are currently valid or, in the case of trademarks, active. To remain in force, IP protection must be maintained.

***Industrial design***

Industrial designs are applied to a wide variety of industrial products and handicrafts. They refer to the ornamental or aesthetic aspects of a useful article, including compositions of lines or colors or any three-dimensional forms that give a special appearance to a product or handicraft. The holder of a registered industrial design has exclusive rights against unauthorized copying or imitation of the design by third parties. Industrial design registrations are valid for a limited period. The term of protection is usually 15 years in most jurisdictions. However, differences in legislation exist, notably in China (which provides for a 10-year term from the application date) and the U.S. (which provides for a 14-year term from the date of registration).

***Intellectual property (IP)***

Creations of the mind: inventions, literary and artistic works, symbols, names, images and designs used

in commerce. IP is divided into two categories: industrial property – which includes patents, utility models, trademarks, industrial designs and geographical indications of source – and copyright, which includes literary and artistic works such as novels, poems, plays, films, musical works, artistic works (such as drawings, paintings, photographs and sculptures) and architectural designs. Rights related to copyright include those of performing artists in their performances, those of producers of sound recordings in their recordings and those of broadcasters in their radio and television programs.

***International Depositary Authority (IDA)***

A scientific institution – typically a culture collection – capable of storing microorganisms that has acquired the status of an International Depositary Authority under the Budapest Treaty and provides for the receipt, acceptance and storage of microorganisms and the furnishing of samples thereof. Currently, 46 such authorities exist around the world.

***International Patent Classification (IPC)***

An international recognized patent classification system, the IPC has a hierarchical structure of language-independent symbols and is divided into sections, classes, sub-classes and groups. IPC symbols are assigned according to the technical features in patent applications. A patent application that relates to multiple technical features can be assigned several IPC symbols.

***International Union for the Protection of New Varieties of Plants (UPOV)***

An intergovernmental organization established by the International Convention for the Protection of New Varieties of Plants (the UPOV Convention), which was adopted on December 2, 1961. UPOV provides and promotes an effective system of plant variety protection with the aim of encouraging the development of new varieties of plants for the benefit of society.

***Invention***

A new solution to a technical problem. To qualify for patent protection, the invention must be novel, involve an inventive step and be industrially applicable, as judged by a person skilled in the art.

***Lisbon System***

The Lisbon System was established in 1958 to facilitate the international protection of appellations of origin through a single registration procedure. Registration with the WIPO International Bureau ensures protection in all Lisbon contracting parties, without need for renewal and as long as the appellation of origin remains protected in its contracting party of origin. However, the decision whether to protect a newly registered appellation of origin at the national level remains the prerogative of each contracting party, and each Lisbon member can refuse protection based on any ground within one year of being notified of a new appellation of origin by the WIPO International Bureau. The Lisbon System is flexible as regards the means which countries may provide protection for the registered appellation of origin (e.g., *sui generis* systems, trademark laws or specific ad hoc decrees as well as judicial and administrative decisions).

***Locarno Classification (LOC)***

The abbreviated form of the International Classification for Industrial Designs under the Locarno Agreement, used for registering industrial designs. The LOC comprises a list of 32 classes and their respective subclasses with explanatory notes plus an alphabetical list of the goods in which industrial designs are incorporated and an indication of the classes and subclasses into which they fall.

***Madrid international application***

An application for international registration under the Madrid System, which is a request for protection of a trademark in one or more Madrid members. An international application must be based on a basic mark – prior application or registration of a mark in a Madrid member.

***Madrid international registration***

An application for international registration of a mark leads to its recording in the International Register and the publication of the international registration in the *WIPO Gazette of International Marks*. If the international registration is not refused protection by a designated Madrid member, it will have the same effect as a national or regional trademark registration made under the law applicable in that Madrid member's jurisdiction.

***Madrid member (Contracting Party)***

A state or intergovernmental organization – for example the European Union (EU) or the African Intellectual Property Organization (OAPI) – that is party to the Madrid Agreement and/or the Madrid Protocol.

***Madrid route***

The Madrid route (the Madrid System) is an alternative to the direct national or regional route (also called the Paris route).

***Madrid System***

An abbreviation describing two procedural treaties for the international registration of trademarks, namely the Madrid Agreement for the International Registration of Marks and the Protocol relating to that Agreement. The Madrid System is administered by the International Bureau of WIPO.

***Maintenance***

An act by the applicant to keep an IP grant/registration valid (in force), primarily by paying the required fee to the IP office of the state or jurisdiction providing protection. That fee is also known as a “maintenance fee.” A trademark can be maintained indefinitely by paying renewal fees; however, patents, utility models and industrial designs can be maintained for only a limited number of years.

***Microorganism deposit***

The transmittal of a microorganism to an International Depository Authority (IDA), which receives and accepts it, the storage of such a microorganism by the IDA, or both transmittal and storage.

***National phase under the PCT***

The phase that follows the international phase of the PCT procedure and that consists of the entry and processing of the international application in the individual countries or regions in which the applicant seeks protection for an invention.

***National route***

Applications for IP protection filed directly with the national office of, or acting for, the relevant state or

jurisdiction (see also “Hague route,” “Madrid route” and “PCT route”). The national route is also called the “direct route” or “Paris route.”

### *Nice Classification (NCL)*

The abbreviated form of the International Classification of Goods and Services for the Purposes of Registering Marks, an international classification established under the Nice Agreement. The Nice Classification consists of 45 classes, which are divided into 34 classes for goods and 11 for services. (See also “Class” above.)

### *Non-resident*

For statistical purposes, a “non-resident” application refers to an application filed with the IP office of, or acting for, a state or jurisdiction in which the first-named applicant in the application is not domiciled. For example, an application filed with the Japan Patent Office (JPO) by an applicant residing in France is considered a non-resident application from the perspective of the JPO. Non-resident applications are sometimes referred to as foreign applications. A non-resident grant or registration is an IP right issued on the basis of a non-resident application.

### *Origin (country or region)*

For statistical purposes, the origin of an application means the country or territory of residence of the first named applicant in the application. In some cases (notably in the U.S.), the country of origin is determined by the residence of the assignee rather than that of the applicant.

### *Paris Convention*

The Paris Convention for the Protection of Industrial Property, signed on March 20, 1883, is one of the most important treaties, as it establishes general principles applicable to all IP rights. It establishes the “right of priority” that enables an IP applicant, when filing an application in countries other than the original country of filing, to claim priority of an earlier application filed up to 12 months previously for patents and utility models, and up to six months previously for trademarks and industrial designs.

### *Paris route*

An alternative to the Hague, Madrid or PCT routes, the Paris route (also called the “direct route” or “national route”) enables individual IP applications to be filed directly with an office that is a signatory to the Paris Convention.

### *Patent*

A set of exclusive rights granted by law to applicants for inventions that are new, non-obvious and commercially applicable. A patent is valid for a limited period of time (generally 20 years), during which patent holders can commercially exploit their inventions on an exclusive basis. In return, applicants are obliged to disclose their inventions to the public in a manner that enables others skilled in the art to replicate the invention. The patent system is designed to encourage innovation by providing innovators with time-limited exclusive legal rights, thus enabling them to appropriate the returns from their innovative activity.

### *Patent Cooperation Treaty (PCT)*

An international treaty administered by WIPO, the PCT allows applicants to seek patent protection for an invention simultaneously in a large number of countries (PCT contracting states) by filing a single PCT international application. The granting of patents, which remains under the control of national or regional patent offices, is carried out in what is called the “national phase” or “regional phase.”

### *Patent family*

Applicants often file patent applications in multiple jurisdictions, so some inventions are recorded more than once. To take this into account, WIPO has indicators related to patent families, defined as patent applications interlinked by one or more of: priority claim, Patent Cooperation Treaty national phase entry, continuation, continuation-in-part, internal priority and addition or division. WIPO’s patent family definition includes only those associated with patent applications for inventions and excludes patent families associated with utility model applications.

***PCT application***

A patent application filed through the WIPO-administered PCT, also known as an international application.

***PCT-Patent Prosecution Highway (PCT-PPH) Pilots***

A number of bilateral agreements signed between patent offices that enable applicants to request an accelerated examination procedure because of positive patentability findings made by the international searching and/or international preliminary examining authority, in the written opinion by an International Searching Authority, the written opinion of an International Preliminary Examining Authority or the international preliminary report on patentability.

***PCT route***

A patent application filed through the WIPO-administered PCT, also known as an international application.

***PCT System***

The PCT, an international treaty administered by WIPO, facilitates the acquisition of patent rights in a large number of jurisdictions. The PCT System simplifies the process of multiple national patent filings by reducing the requirement to file a separate application in each jurisdiction. However, the decision whether to grant patent rights remains in the hands of national and regional patent offices, and patent rights remain limited to the jurisdiction of the patent-granting authority. The PCT application process starts with the international phase, during which an international search and possibly a preliminary examination are performed, and concludes with the national phase, during which a national or regional patent office decides on the patentability of an invention according to national law.

***Pending patent application***

In general, this refers to a patent application filed with a patent office for which no patent has yet been granted or refused, and for which the application has not been withdrawn. In jurisdictions where a request for examination is required to start the examination process,

a pending application may refer to an application for which a request for examination has been received or one for which no patent has been granted or refused, and for which the application has not been withdrawn.

***Plant Patent Act (PPA) of the U.S.***

Under the law commonly known as the “Plant Patent Act,” whoever invents or discovers and asexually reproduces any distinct and new variety of plant, including cultivated sports, mutants, hybrids and newly-found seedlings, other than a tuber-propagated plant or a plant found in an uncultivated state, may obtain a patent therefor.

***Plant variety***

According to the UPOV Convention, plant variety means a plant grouping within a single botanical taxon of the lowest known rank which, irrespective of whether the conditions for the grant of a breeder’s right are fully met, can be defined by the expression of the characteristics resulting from a given genotype or combination of genotypes, distinguished from any other plant grouping by the expression of at least one of the said characteristics and considered as a unit with regard to its suitability for being propagated unchanged.

***Plant variety grant***

Under the UPOV Convention, the breeder’s right is granted (title of protection is issued) only when the variety is new, distinct, uniform, stable and has a suitable denomination.

***Plant Variety Protection Act (PVPA) of the U.S.***

Under the PVPA, the U.S. protects all sexually reproduced plant varieties and tuber-propagated plant varieties, excluding fungi and bacteria.

***Prior art***

All information disclosed to the public about an invention, in any form, before a given date. Information on prior art can assist in determining whether the claimed invention is new and involves an inventive step (i.e., is nonobvious) for the purposes of international searches and international preliminary examination.

***Priority date***

The filing date of the application on the basis of which priority is claimed. (See “Paris Convention” above.)

***Publication date***

The date on which an IP application is disclosed to the public. On that date, the subject matter of the application becomes prior art.

***Regional application/grant (registration)***

An application filed with or granted (registered) by an IP office having regional jurisdiction over more than one country. There are currently seven regional offices: the African Intellectual Property Organization (OAPI), the African Regional Intellectual Property Organization (ARIPO), the Benelux Office for Intellectual Property (BOIP), the Eurasian Patent Organization (EAPO), the European Patent Office (EPO), the European Union Intellectual Property Office (EUIPO) and the Patent Office of the Cooperation Council for the Arab States of the Gulf (GCC Patent Office).

***Registered Community design***

A registration issued by the EUIPO based on a single application filed directly with the office by an applicant seeking protection within the EU as a whole.

***Registration***

An exclusive set of rights legally accorded to the applicant when an industrial design or trademark is registered or issued. See “Industrial design” or “Trademark.” Registrations are issued to applicants to make use of and exploit their industrial design or trademark for a limited period of time and can, in some cases (particularly in the case of trademarks), be renewed indefinitely.

***Renewal***

The process by which the protection of an IP right is maintained (i.e., kept in force). Usually consists of paying renewal fees to an IP office at regular intervals. If renewal fees are not paid, the registration may lapse. See also “Maintenance.”

***Resident***

For statistical purposes, a resident application refers to an application filed with the IP office of, or acting for, the state or jurisdiction in which the first named applicant in the application has residence. For example, an application filed with the JPO by a resident of Japan is considered a resident application for the JPO. Resident applications are sometimes referred to as “domestic applications.” A resident grant/registration is an IP right issued on the basis of a resident application.

***Trademark***

A sign used by the owner of specific goods or services to distinguish them from those of others. Depending on the jurisdiction, a trademark can consist of words and combinations of words (for instance, slogans), names, logos, figures and images, letters, numbers, smells, sounds and moving images, or a combination thereof. The procedures for registering trademarks are governed by the legislation and procedures of national and regional IP offices and WIPO. Trademark rights are limited to the jurisdiction of the IP office that registers the trademark. Trademarks can be registered by filing an application at the relevant national or regional office(s), or by filing an international application through the Madrid System.

***Utility model***

A special form of patent right granted by a state or jurisdiction to an inventor or the inventor’s assignee for a fixed period of time. The terms and conditions for granting a utility model are slightly different from those for normal patents (including a shorter term of protection and less stringent patentability requirements). The term can also describe what are known in certain countries as “petty patents,” “short-term patents” or “innovation patents.”

***World Intellectual Property Organization (WIPO)***

A United Nations specialized agency dedicated to the promotion of innovation and creativity for the economic, social and cultural development of all countries through a balanced and effective international IP system. WIPO was established in 1967 with a mandate to promote the protection of IP throughout the world through cooperation among states and in collaboration with other international organizations.

## Annex B

### Definitions for selected energy-related technology fields

Energy-related technologies	International patent classification (IPC) symbols
Solar energy technology	F24J 2/00, F24J 2/02, F24J 2/04, F24J 2/05, F24J 2/06, F24J 2/07, F24J 2/08, F24J 2/10, F24J 2/12, F24J 2/13, F24J 2/14, F24J 2/15, F24J 2/16, F24J 2/18, F24J 2/23, F24J 2/24, F24J 2/36, F24J 2/38, F24J 2/42, F24J 2/46, F03G 6/06, G02B 5/10, H01L 31/052, E04D 13/18, H01L 31/04, H01L 31/042, H01L 31/18, E04D 1/30, G02F 1/136, G05F 1/67, H01L 25/00, H01L 31/00, H01L 31/048, H01L 33/00, H02J 7/35, H02N 6/00
Fuel cell technology	H01M 4/00, H01M 4/86, H01M 4/88, H01M 4/90, H01M 8/00, H01M 8/02, H01M 8/04, H01M 8/06, H01M 8/08, H01M 8/10, H01M 8/12, H01M 8/14, H01M 8/16, H01M 8/18, H01M 8/20, H01M 8/22, H01M 8/24
Wind energy	F03D 1/00, F03D 3/00, F03D 5/00, F03D 7/00, F03D 9/00, F03D 11/00, B60L 8/00
Geothermal energy	F24J 3/08, F03G 4/00, F03G 7/05

Note: For definitions of IPC symbols, see [www.wipo.int/classifications/ipc](http://www.wipo.int/classifications/ipc). The correspondence between IPC symbols and technology fields is not always clear-cut, and so it is difficult to capture all patents in a specific technology field. Nonetheless, the IPC-based definitions of the four technologies presented above are likely to capture the vast majority of related patents.

## Annex C

### International Classification of Goods and Services under the Nice Agreement

Class heading	Goods or services
Class 3	Bleaching preparations and other substances for laundry use; cleaning, polishing, scouring and abrasive preparations; soaps; perfumery, essential oils, cosmetics, hair lotions; dentifrices
Class 5	Pharmaceutical and veterinary preparations; sanitary preparations for medical purposes; dietetic substances adapted for medical use, food for babies; plasters, materials for dressings; material for stopping teeth, dental wax; disinfectants; preparations for destroying vermin; fungicides, herbicides
Class 9	Scientific, nautical, surveying, photographic, cinematographic, optical, weighing, measuring, signaling, checking (supervision), life-saving and teaching apparatus and instruments; apparatus and instruments for conducting, switching, transforming, accumulating, regulating or controlling electricity; apparatus for recording, transmission or reproduction of sound or images; magnetic data carriers, recording discs; automatic vending machines and mechanisms for coin-operated apparatus; cash registers, calculating machines, data processing equipment and computers; fire-extinguishing apparatus
Class 25	Clothing, footwear, headgear
Class 29	Meat, fish, poultry and game; meat extracts; preserved, frozen, dried and cooked fruits and vegetables; jellies, jams, compotes; eggs; milk and milk products; edible oils and fats
Class 30	Coffee, tea, cocoa, sugar, rice, tapioca, sago, artificial coffee; flour and preparations made from cereals, bread, pastry and confectionery, ices; honey, treacle; yeast, baking-powder; salt, mustard; vinegar, sauces (condiments); spices; ice
Class 35	Advertising; business management; business administration; office functions
Class 41	Education; providing of training; entertainment; sporting and cultural activities
Class 42	Scientific and technological services and research and design relating thereto; industrial analysis and research services; design and development of computer hardware and software
Class 43	Services for providing food and drink; temporary accommodation

Note: See [www.wipo.int/classifications/nice](http://www.wipo.int/classifications/nice) for a complete list of all classes and further information on the International Classification of Goods and Services under the Nice Agreement.

Industry sector	Abbreviation (where applicable)	Nice classes
Agricultural products and services	Agriculture	29, 30, 31, 32, 33, 43
Management, Communications, Real estate and Financial services	Business services	35, 36
Chemicals	-	1, 2, 4
Textiles – Clothing and Accessories	Clothing	14, 18, 22, 23, 24, 25, 26, 27, 34
Construction, Infrastructure	Construction	6, 17, 19, 37, 40
Pharmaceuticals, Health, Cosmetics	Health	3, 5, 10, 44
Household equipment	-	8, 11, 20, 21
Leisure, Education, Training	Leisure & Education	13, 15, 16, 28, 41
Scientific research, Information and Communication Technology	Research & Technology	9, 38, 42, 45
Transportation and Logistics	Transportation	7, 12, 39

## Annex D

### International Classification for Industrial Designs (Locarno Classification)

Class Heading	Goods
Class 2	Articles of clothing and haberdashery
Class 6	Furnishing
Class 7	Household goods, not elsewhere specified
Class 9	Packages and containers for the transport or handling of goods
Class 11	Articles of adornment
Class 12	Means of transport or hoisting
Class 14	Recording, communication or information retrieval equipment
Class 25	Building units and construction elements
Class 26	Lighting apparatus
Class 32	Graphic symbols and logos, surface patterns, ornamentation

Note: See [www.wipo.int/classifications/locarno](http://www.wipo.int/classifications/locarno) for a complete list of all classes and further information.

Source: WIPO.

Locarno classes	Sector
20, 32	Advertising
1, 27, 31	Agricultural products and food preparation
23, 25, 29	Construction
13, 26	Electricity and lighting
6, 7, 30	Furniture and household goods
24, 28	Health, pharma and cosmetics
14, 16, 18	ICT and audiovisual
17, 19, 21, 22	Leisure and education
9	Packaging
2, 3, 5, 11	Textiles and accessories
4, 8, 10, 15	Tools and machines
12	Transport

# Notes

## Preliminary

1. The products and handicrafts to which industrial designs are applied range from technical and medical instruments to watches, jewelry and other luxury items, and from housewares, electrical appliances, vehicles and construction materials to textile designs and leisure goods.

## Special section

1. Benjamin Mitra-Kahn, Alan Marco, Michael Carley, Paul D'Agostino, Peter Evans, Carl Frey, Nadiya Sultan (2013). *Patent Backlogs, Inventories and Pendency: An International Framework*. Newport, United Kingdom: United Kingdom Intellectual Property Office/ United States Patent and Trademark Office.

Gaétan de Rassenfosse and Alexandra K. Zaby (2016). *The Economics of Patent Backlog*.

Wesley M. Cohen and Stephen A. Merrill (eds.) (2003). *Patents in the Knowledge-Based Economy*. Washington, D.C.: National Academies Press.

Adam B. Jaffe and Josh Lerner (2004). *Innovation and Its Discontents: How Our Broken Patent System is Endangering Innovation and Progress, and What to Do About It*. Princeton, N.J.: Princeton University Press.

*The Economist*. "Getting serious about patents," November 3, 2012; "Patently absurd," May 5, 2011; "Patent fiction," December 11, 2014.

2. Having an adequate number of examiners is essential for the timely processing of applications. However, other factors, such as IT infrastructure, greater cooperation among offices and so on can contribute to the efficient processing of applications.

3. Richard A. Posner, "Why there are too many patents in America," *The Atlantic*, July 12, 2012.

4. Michael D. Frakes and Melissa F. Wasserman (2015). "Does the U.S. Patent and Trademark Office grant too many bad patents? Evidence from a quasi-experiment," 67 *Stanford Law Review*, 613-676.

5. In order to work out the grant rate of all applications filed in 2016, one would need to wait between 5 and 10 years. Reporting data with a 5 to 10-year lag has limited value for policy-making.

## Trademarks

1. Equivalent application class counts differ from the absolute class counts, which are presented in figure B20 and do not take into account the multiplying effect of regional offices.

## Plant varieties

1. Throughout this section, U.S. data refer to a combination of Plant Variety Protection Act and Plant Patent Act data. However, separate data relating to each Act are given in statistical table D16.

## Geographical indications

1. Recently, the Organization for an International Geographical Indications Network (oriGIn), which is a non-governmental organization (NGO), published GI data for a large number of countries: [www.origin-gi.com](http://www.origin-gi.com).

2. The terminology used at national and regional levels to refer to *sui generis* rights over GIs is not uniform. Different terms such as appellations of origin, controlled appellations of origin, protected designations of origin,

protected geographical indications, (qualified) indications of source or simply geographical indications are used in different legislations. Despite the different terminology, however, the common denominator shall remain the link between the specific quality, characteristics or reputation of the product and its territory of origin. For simplicity, the present text generally uses "geographical indication (GI)" regardless of the different national and regional terminology.

3. The Lisbon System is administered by WIPO and comprises the Lisbon Agreement for the Protection of Appellations of Origin and their International Registration (1958), as revised at Stockholm in 1967 and amended in 1979, and the Geneva Act of the Lisbon Agreement on Appellations of Origin and Geographical Indications (2015), which has not yet entered into force.

4. For more information about the Madrid System, please see the *Madrid Yearly Review 2017*.

5. In principle, double-counting of the same subject matter protected by different IP rights also occurs in patent, trademark and industrial design statistics. However, the inclusion of GIs covered in trade agreements adds a layer of complexity, as relevant GIs may, in some case, only have legal effect once registered at the national level.

## Additional information

1. The products and handicrafts to which industrial designs are applied range from technical and medical instruments to watches, jewelry and other luxury items, and from housewares, electrical appliances, vehicles and construction materials to textile designs and leisure goods.

The *World Intellectual Property Indicators* is the annual survey of intellectual property (IP) activity around the world from WIPO, the United Nations specialized agency for innovation and IP.

This authoritative report analyzes IP activity across patents, utility models, trademarks, industrial designs, microorganisms and plant variety protection, drawing on filing, registration and renewals statistics from national and regional IP offices and WIPO.

For the first time, this year's edition also includes data on geographical indications, making it even more comprehensive. And a special section on the operational performance of patent offices takes an in-depth look at application processing times, examination capacity and examination outcomes.
